 CC haplotypes using the genes comprising grouping at least two nucleic acids
 CC ; (4) identifying (M3) an individual at risk of developing a disorder
 CC upon administration of an ACE inhibitor and/or vasopressinase inhibitor
 CC using the polymorphic data; (5) a library of nucleic acids, each of which
 CC comprises one or more polymorphic positions within a gene encoding a
 CC human protein selected from the group above; and (6) genotyping (M4) an
 CC individual comprising obtaining a nucleic acid sample, determining the
 CC nucleotide present in at least one polymorphic position, and comparing at
 CC least one position with a known data set. The genes, (M1, M2, M3 and M4)
 CC and compositions are useful for detecting, diagnosing, treating,
 CC preventing various disorders such as angioedema and diseases which
 CC involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's
 CC disease, trachomas, and cardiovascular diseases like angina pectoris,
 CC hypertension, heart failure, myocardial infarction, ventricular
 CC hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary
 CC artery disease, arteriosclerosis and/or atherosclerosis, and
 CC hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory
 CC arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic
 CC obstructive pulmonary disease (COPD) and enterocolitis (many other
 CC diseases and disorders are listed in the specification). The
 CC polymorphisms are also useful for chromosome identification. Antibodies
 CC against the proteins may be utilised for immunophenotyping of cell lines
 CC and biological samples. The present sequence is a genotyping PCR primer
 CC for the gene encoding one of the proteins listed above

 PT Treating pathological condition involving neurokinin receptor-1, e.g.
 PT pain or inflammation, by administering oligonucleotide or a non-
 PT nucleotide disruptor compound which modulate NK-1 receptor biosynthetic
 PT pathway.
 XX
 PS Claim 24; Page 20; 100pp; English.
 XX
 CC The invention relates to a method of treating a pathological condition
 CC characterised partially by involvement of neurokinin receptor-1 (NK-1)
 CC receptor, especially treating, attenuating or preventing pain or
 CC inflammatory condition. The method comprises administering to a mammal, a
 CC compound chosen from an oligonucleotide, its analogue, and a disruptor
 CC which interferes with function or production of NK-1 receptors. The
 CC method is useful for treating a pathological condition characterised by
 CC involvement of NK-1 receptor such as dermatological, immune, autoimmune,
 CC cardiovascular, vascular disorders (e.g. migraine), airway, neuropathic,
 CC psychiatric and central nervous system disorders (e.g. anxiety,
 CC psychosis, schizophrenia), gut inflammation, arthritis, and central or
 CC peripheral aspects of chronic or acute pain, and for treating,
 CC attenuating or preventing pain or inflammation, neuropathic pain, inflammation or
 CC chronic, acute pain or inflammation, central nervous system
 CC pain relating to psychiatric disorders and central nervous system
 CC disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia
 CC in a mammal, in particular human. NK-1 receptor related disorders,
 CC diseases, or pathological conditions treatable by this method include
 CC respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic
 CC conditions (e.g. conjunctivitis), cutaneous/dermatological conditions
 CC (allergic dermatitis), intestinal conditions (stroke), chronic
 CC Crohn's disease), cardiovascular conditions (stroke), chronic
 CC gastrointestinal tract inflammation, and inflammatory diseases such as
 CC inflammatory bowel diseases. Other disorders and diseases include
 CC cardiovascular pathologies including stroke, chronic inflammatory
 CC diseases such as rheumatoid arthritis, demyelinating diseases such as
 CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity
 CC disorders such as allergies and poison ivy, vasospastic diseases such as
 CC angina, addiction disorders such as alcoholism, neurodegenerative
 CC disorders such as acquired immune deficiency syndrome (AIDS) related
 CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
 CC disorders such as peripheral neuropathy, oedema, stress related and
 CC somatic disorders, and osteoarthritis. Antisense oligonucleotides
 CC effectively treat chronic conditions and other pathological states
 CC without the co-administration of substance P, and reduce the number of
 CC activated receptors while not reducing the number of quiescent NK-1
 CC receptors. Receptors not chronically stimulated are less affected,
 CC reducing side effects of treatment. ABK63834-ABK63906 represent NK-1
 CC receptor coding sequences and oligonucleotides of the invention

 XX
 CC The invention relates to a method of treating a pathological condition
 CC characterised partially by involvement of neurokinin receptor-1 (NK-1)
 CC receptor, especially treating, attenuating or preventing pain or
 CC inflammatory condition. The method comprises administering to a mammal, a
 CC compound chosen from an oligonucleotide, its analogue, and a disruptor
 CC which interferes with function or production of NK-1 receptors. The
 CC method is useful for treating a pathological condition characterised by
 CC involvement of NK-1 receptor such as dermatological, immune, autoimmune,
 CC cardiovascular, vascular disorders (e.g. migraine), airway, neuropathic,
 CC psychiatric and central nervous system disorders (e.g. anxiety,
 CC psychosis, schizophrenia), gut inflammation, arthritis, and central or
 CC peripheral aspects of chronic or acute pain, and for treating,
 CC attenuating or preventing pain or inflammation, neuropathic pain, inflammation or
 CC chronic, acute pain or inflammation, central nervous system
 CC pain relating to psychiatric disorders and central nervous system
 CC disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia
 CC in a mammal, in particular human. NK-1 receptor related disorders,
 CC diseases, or pathological conditions treatable by this method include
 CC respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic
 CC conditions (e.g. conjunctivitis), cutaneous/dermatological conditions
 CC (allergic dermatitis), intestinal conditions (stroke), chronic
 CC Crohn's disease), cardiovascular conditions (stroke), chronic
 CC gastrointestinal tract inflammation, and inflammatory diseases such as
 CC inflammatory bowel diseases. Other disorders and diseases include
 CC cardiovascular pathologies including stroke, chronic inflammatory
 CC diseases such as rheumatoid arthritis, demyelinating diseases such as
 CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity
 CC disorders such as allergies and poison ivy, vasospastic diseases such as
 CC angina, addiction disorders such as alcoholism, neurodegenerative
 CC disorders such as acquired immune deficiency syndrome (AIDS) related
 CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
 CC disorders such as peripheral neuropathy, oedema, stress related and
 CC somatic disorders, and osteoarthritis. Antisense oligonucleotides
 CC effectively treat chronic conditions and other pathological states
 CC without the co-administration of substance P, and reduce the number of

CC activated receptors while not reducing the number of quiescent NK-1
CC receptors. Receptors not chronically stimulated are less affected,
CC reducing side effects of treatment. ABR63834-ABR63906 represent NK-1
CC receptor coding sequences and oligonucleotides of the invention

PT pathway.

XX Claim 24; Page 65; 100pp; English.

XX The invention relates to a method of treating a pathological condition
CC characterised partially by involvement of neurokinin receptor-1 (NK-1)
CC receptor, especially treating, attenuating or preventing pain or
CC inflammatory condition. The method comprises administering to a mammal, a
CC compound chosen from an oligonucleotide, its analogue, and a disruptor
CC which interferes with function or production of NK-1 receptors. The
CC method is useful for treating a pathological condition characterised by
CC involvement of NK-1 receptor such as dermatological, immune, autoimmune,
CC cardiovascular, vascular disorders (e.g. migraine), allergy, neuropathic,
CC psychiatric and central nervous system disorders (e.g. anxiety,
CC psychosis, schizophrenia), gut inflammation, arthritis, and central or
CC peripheral aspects of chronic or acute pain, and for treating,
CC attenuating or preventing pain or inflammation, neuropathic pain, inflammation or
CC chronic, acute pain or inflammation, neuropathic pain, inflammation or
CC pain relating to psychiatric disorders and central nervous system
CC disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia
CC in a mammal, in particular human. NK-1 receptor related disorders,
CC diseases, or pathological conditions treatable by this method include
CC respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic
CC conditions (e.g. conjunctivitis), cutaneous/dermatological conditions
CC (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and
CC Crohn's disease), cardiovascular conditions (stroke), chronic
CC gastrointestinal tract inflammation, and inflammatory diseases such as
CC inflammatory bowel diseases. Other disorders and diseases include
CC cardiovascular pathologies including stroke, chronic inflammatory
CC diseases such as rheumatoid arthritis, demyelinating diseases such as
CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity
CC disorders such as allergies and poison ivy, vasospastic diseases such as
CC angina, addiction disorders such as alcoholism, neurodegenerative
CC disorders such as acquired immune deficiency syndrome (AIDS) related
CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
CC disorders such as peripheral neuropathy, oedema, stress related and
CC somatic disorders, and osteoarthritis. Antisense oligonucleotides
CC effectively treat chronic conditions and other pathological states
CC without the co-administration of substance P, and reduce the number of
CC activated receptors while not reducing the number of quiescent NK-1
CC receptors. Receptors not chronically stimulated are less affected,
CC reducing side effects of treatment. ABK63834-ABK63906 represent NK-1
CC receptor coding sequences and oligonucleotides of the invention

XX Treating pathological condition involving neurokinin receptor-1, e.g.
XX pain or inflammation, by administering oligonucleotide or a non-
XX nucleotide disruptor compound which modulate NK-1 receptor biosynthetic
XX pathway.
XX
XX Example 18; Page 65; 100pp; English.
XX
XX The invention relates to a method of treating a pathological condition
XX characterised partially by involvement of neurokinin receptor-1 (NK-1)
XX receptor, especially treating, attenuating or preventing pain or
XX inflammatory condition. The method comprises administering to a mammal, a
XX compound chosen from an oligonucleotide, its analogue, and a disruptor
XX which interferes with function or production of NK-1 receptors. The
XX method is useful for treating a pathological condition characterised by
XX involvement of NK-1 receptor such as dermatological, immune, autoimmune,
XX cardiovascular, vascular disorders (e.g. migraine), airway, neuropathic,
XX psychiatric and central nervous system disorders (e.g. anxiety,
XX psychosis, schizophrenia), gut inflammation, arthritis, and central or
XX peripheral aspects of chronic or acute pain, and for treating,
XX attenuating or preventing pain or inflammation such as peripheral,
XX chronic, acute pain or inflammation, neuropathic pain, inflammation or
XX pain relating to psychiatric disorders and central nervous system
XX disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia
XX in a mammal, in particular human. NK-1 receptor related disorders,
XX diseases, or pathological conditions treatable by this method include
XX respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic
XX conditions (e.g. conjunctivitis), cutaneous/dermatological conditions
XX (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and
XX Crohn's disease), cardiovascular conditions (stroke), chronic
XX gastrointestinal tract inflammation, and inflammatory diseases such as
XX inflammatory bowel diseases. Other disorders and diseases include
XX cardiovascular pathologies including stroke, chronic inflammatory
XX diseases such as rheumatoid arthritis, demyelinating diseases such as
XX multiple sclerosis, small cell lung cancer, depression, hypersensitivity
XX disorders such as allergies and poison ivy, vasospastic diseases such as
XX angina, addiction disorders such as alcoholism, neurodegenerative
XX disorders such as acquired immune deficiency syndrome (AIDS) related
XX dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
XX disorders such as peripheral neuropathy, oedema, stress related and
XX somatic disorders, and osteoarthritis. Antisense oligonucleotides
XX effectively treat chronic conditions and other pathological states

CC without the co-administration of substance P, and reduce the number of
CC activated receptors while not reducing the number of quiescent NK-1
CC receptors. Receptors not chronically stimulated are less affected,
CC reducing side effects of treatment. ABR63894-ABR63906 represent NK-1

XX Claim 24; Page 20; 100pp; English.

PS The invention relates to a method of treating a pathological condition

CC characterised partially by involvement of neurokinin receptor-1 (NK-1)

CC receptor, especially treating, attenuating or preventing pain or

CC inflammatory condition. The method comprises administering to a mammal, a

CC compound chosen from an oligonucleotide, its analogue, and a disruptor

CC which interferes with function or production of NK-1 receptors. The

CC method is useful for treating a pathological condition characterised by

CC involvement of NK-1 receptor such as dermatological, immune, autoimmune,

CC cardiovascular, vascular disorders (e.g. migraine), allergy, neuropathic,

CC psychiatric and central nervous system disorders (e.g. anxiety,

CC psychosis, schizophrenia), gut inflammation, arthritis, and central or

CC peripheral aspects of chronic or acute pain, and for treating,

CC attenuating or preventing pain or inflammation such as peripheral,

CC chronic, acute pain or inflammation, neuropathic pain, inflammation or

CC pain relating to psychiatric disorders and central nervous system

CC disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia

CC in a mammal, in particular human. NK-1 receptor related disorders,

CC diseases, or pathological conditions treatable by this method include

CC respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic

CC conditions (e.g. conjunctivitis), cutaneous/dermatological conditions

CC (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and

CC Crohn's disease), cardiovascular conditions (stroke), chronic

CC gastrointestinal tract inflammation, and inflammatory diseases such as

CC inflammatory bowel diseases. Other disorders and diseases include

CC cardiovascular pathologies including stroke, chronic inflammatory

CC diseases such as rheumatoid arthritis, demyelinating diseases such as

CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity

CC disorders such as allergies and poison ivy, vasospastic diseases such as

CC angina, addiction disorders such as alcoholism, neurodegenerative

CC disorders such as acquired immune deficiency syndrome (AIDS) related

CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological

CC disorders such as peripheral neuropathy, oedema, stress related and

CC somatic disorders, and osteoarthritis. Antisense oligonucleotides

CC effectively treat chronic conditions and other pathological states

CC without the co-administration of substance P, and reduce the number of

CC activated receptors while not reducing the number of quiescent NK-1

CC receptors. Receptors not chronically stimulated are less affected,

CC reducing side effects of treatment. ABK63834-ABK63906 represent NK-1

CC receptor coding sequences and oligonucleotides of the invention

Treating pathological condition involving neurokinin receptor-1, e.g. pain or inflammation, by administering oligonucleotide or a non-nucleotide disruptor compound which modulate NK-1 receptor biosynthetic pathway.

Example 18; Page 65; 100pp; English.

The invention relates to a method of treating a pathological condition characterised partially by involvement of neurokinin receptor-1 (NK-1) receptor, especially treating, attenuating or preventing pain or inflammatory condition. The method comprises administering to a mammal, a compound chosen from an oligonucleotide, its analogue, and a disruptor which interferes with function or production of NK-1 receptors. The method is useful for treating a pathological condition characterised by involvement of NK-1 receptor such as dermatological, immune, autoimmune, cardiovascular, vascular disorders (e.g. migraine), allergy, neuropathic, psychiatric and central nervous system disorders (e.g. anxiety, psychosis, schizophrenia), gut inflammation, arthritis, and central or peripheral aspects of chronic or acute pain, and for treating,

attenuating or preventing pain or inflammation such as peripheral, chronic, acute pain or inflammation, neuropathic pain, inflammation or pain relating to psychiatric disorders and central nervous system disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia in a mammal, in particular human. NK-1 receptor related disorders, diseases, or pathological conditions treatable by this method include respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic conditions (e.g. conjunctivitis), cutaneous/dermatological conditions (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and Crohn's disease), cardiovascular conditions (stroke), chronic gastrointestinal tract inflammation, and inflammatory diseases such as inflammatory bowel diseases. Other disorders and diseases include cardiovascular pathologies including stroke, chronic inflammatory diseases such as rheumatoid arthritis, demyelinating diseases such as multiple sclerosis, small cell lung cancer, depression, hypersensitivity disorders such as allergies and poison ivy, vasospastic diseases such as angina, addiction disorders such as alcoholism, neurodegenerative disorders such as acquired immune deficiency syndrome (AIDS) related dementia, epilepsy, Alzheimer's disease, and other neuro-pathological disorders such as peripheral neuropathy, oedema, stress related and somatic disorders, and osteoarthritis. Antisense oligonucleotides effectively treat chronic conditions and other pathological states without the co-administration of substance P, and reduce the number of activated receptors while not reducing the number of quiescent NK-1 receptors. Receptors not chronically stimulated are less affected, reducing side effects of treatment. ABR63834-ABR63906 represent NK-1 receptor coding sequences and oligonucleotides of the invention

CC The invention relates to a method of treating a pathological condition

CC characterised partially by involvement of neurokinin receptor-1 (NK-1)

CC receptor, especially treating, attenuating or preventing pain or

CC inflammatory condition. The method comprises administering to a mammal, a

CC compound chosen from an oligonucleotide, its analogue, and a disruptor

CC which interferes with function or production of NK-1 receptors. The

CC method is useful for treating a pathological condition characterised by

CC involvement of NK-1 receptor such as dermatological, immune, autoimmune,

CC cardiovascular, vascular disorders (e.g. migraine), allergy, neuropathic,

CC psychiatric and central nervous system disorders (e.g. anxiety,

CC psychosis, schizophrenia), gut inflammation, arthritis, and central or

CC peripheral aspects of chronic or acute pain, and for treating,

CC attenuating or preventing pain or inflammation such as peripheral,

CC chronic, acute pain or inflammation, neuropathic pain, inflammation or

CC pain relating to psychiatric disorders and central nervous system

CC disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia

CC in a mammal, in particular human. NK-1 receptor related disorders,

CC diseases, or pathological conditions treatable by this method include

CC respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic

CC conditions (e.g. conjunctivitis), cutaneous/dermatological conditions

CC (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and

CC Crohn's disease), cardiovascular conditions (stroke), chronic

CC gastrointestinal tract inflammation, and inflammatory diseases such as

CC inflammatory bowel diseases. Other disorders and diseases include

CC cardiovascular pathologies including stroke, chronic inflammatory

CC diseases such as rheumatoid arthritis, demyelinating diseases such as

CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity

CC disorders such as allergies and poison ivy, vasospastic diseases such as

CC angina, addiction disorders such as alcoholism, neurodegenerative

CC disorders such as acquired immune deficiency syndrome (AIDS) related

CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological

CC disorders such as peripheral neuropathy, oedema, stress related and

CC somatic disorders, and osteoarthritis. Antisense oligonucleotides

CC effectively treat chronic conditions and other pathological states

XX
CC The invention relates to a method of treating a pathological condition
CC characterised partially by involvement of neurokinin receptor-1 (NK-1)
CC receptor, especially treating, attenuating or preventing pain or
CC inflammatory condition. The method comprises administering to a mammal, a
CC compound chosen from an oligonucleotide, its analogue, and a disruptor
CC which interferes with function or production of NK-1 receptors. The
CC method is useful for treating a pathological condition characterised by
CC involvement of NK-1 receptor such as dermatological, immune, autoimmune,
CC cardiovascular, vascular disorders (e.g. migraine), allergy, neuropathic,
CC psychiatric and central nervous system disorders (e.g. anxiety,
CC psychosis, schizophrenia), gut inflammation, arthritis, and central or
CC peripheral aspects of chronic or acute pain, and for treating,
CC attenuating or preventing pain or inflammation such as peripheral,
CC chronic, acute pain or inflammation, neuropathic pain, inflammation or
CC pain relating to psychiatric disorders and central nervous system
CC disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia
CC in a mammal, in particular human. NK-1 receptor related disorders,
CC diseases, or pathological conditions treatable by this method include
CC respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic
CC conditions (e.g. conjunctivitis), cutaneous/dermatological conditions
CC (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and
CC Crohn's disease), cardiovascular conditions (stroke), chronic
CC gastrointestinal tract inflammation, and inflammatory diseases such as
CC inflammatory bowel diseases. Other disorders and diseases include
CC cardiovascular pathologies including stroke, chronic inflammatory
CC diseases such as rheumatoid arthritis, demyelinating diseases such as
CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity
CC disorders such as allergies and poison ivy, vasospastic diseases such as
CC angina, addiction disorders such as alcoholism, neurodegenerative
CC disorders such as acquired immune deficiency syndrome (AIDS) related
CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
CC disorders such as peripheral neuropathy, oedema, stress related and
CC somatic disorders, and osteoarthritis. Antisense oligonucleotides

XX PS Example; Page 9; 40pp; English.
XX CC This PCR primer was used with AAQ37209 to amplify the predicted human
XX CC substance P receptor coding region from 1M-9 cDNA. The amplified fragment
XX CC was blunt end ligated into SmaI-digested pBS. Transformants were further
XX CC analysed by restriction mapping and by sequence analysis. One cDNA was
XX CC isolated after restriction with HindIII and BamHI (present in the pBS
XX CC polylinker) and made blunt ended with Klenow, as was pM2 after BamHI
XX CC digestion. The cDNA was ligated to pM2 and used to transform E. coli XL-1
XX CC Blue cells by electroporation. (Updated on 25-MAR-2003 to correct PN
XX CC field.)

XX PT New human neurokinin-1 receptor short form protein - useful for
XX PT identifying and determining substance P antagonists in arthritic
XX PT patients.
XX PS Example 1; Page 8; 36pp; English.
XX CC Human mRNA was prepared from 3 glioblastoma cell lines T98G, CCF-STG1
XX CC and U87MG. First strand cDNA was synthesised and used as template with
XX CC rat primers rspr2s4, rspr2s4h and rspr7a2 (AAQ30774-6) in first round PCR
XX CC amplification. Secondary PCR was performed on the amplified product using
XX CC the same 3 primers prior to a third round of amplification, this time
XX CC using the primers rspr2s4, rspr2s4h, rspr7a1 (AAQ30777) and rspr7a1h
XX CC (AAQ30778). The tertiary PCR product was sequenced and was found to have
XX CC 90% identity at the nucleotide level with the central core region of the
XX CC rat NK1R from amino acid 91 to 280. Primer rspr7a1h is an antisense
XX CC primer based on the rat NK1R sequence 864-841 (numbering as in
XX CC J Biol. Chem. 264: 17649-17652, 1989), but designed to incorporate the
```

CC human codon bias. (Updated on 25-MAR-2003 to correct PN field.)

 XX
 XX New isolated nucleic acid with at least one polymorphic position, useful
 PT for detecting, diagnosing and treating disorders such as angioedema,
 PT cancer, viral, bacterial or fungal infection, cardiovascular and
 PT autoimmune diseases.
 XX
 PS Example 3; Page 899; 977pp; English.
 XX
 XX The invention relates to an isolated nucleic acid from a human gene
 CC encoding aminopeptidase P (XPNP2), bradykinin receptor B1 (BDKRB1),
 CC tachykinin receptor B1 (TACR1), C1 esterase inhibitor (C1NH), kallikrein
 CC 1 (K1K1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme
 CC 2 (ACE2) or protease inhibitor 4 (P14), comprising at least one
 CC polymorphic position. Also included are (1) a probe that hybridises to a
 CC polymorphic position as provided in the detailed summary of single
 CC nucleotide polymorphisms comprising additional 5' and 3' flanking genomic
 CC sequence; (2) analysing (MI) at least one nucleic acid sample comprising

CC obtaining the sample from one or more individuals and determining the
 CC nucleic acid sequence at one or more polymorphic positions in a gene
 CC encoding a protein selected from the group above; (3) constructing (M2)
 CC haplotypes using the genes comprising groupings at least two nucleic acids
 CC ; (4) identifying (M3) an individual at risk of developing a disorder
 CC upon administration of an ACE inhibitor and/or vasopressinase inhibitor
 CC using the polymorphic data; (5) a library of nucleic acids, each of which
 CC comprises one or more polymorphic positions within a gene encoding a
 CC human protein selected from the group above; and (6) genotyping (M4) an
 CC individual comprising obtaining a nucleic acid sample, determining the
 CC nucleotide present in at least one polymorphic position, and comparing at
 CC least one position with a known data set. The genes, (M1, M2, M3 and M4)
 CC and compositions are useful for detecting, diagnosing, treating,
 CC preventing various disorders such as angioedema and diseases which
 CC involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's
 CC disease, trachomas, and cardiovascular diseases like angina pectoris,
 CC hypertension, heart failure, myocardial infarction, thrombosis, coronary
 CC artery disease, arteriosclerosis and/or atherosclerosis, and
 CC hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory
 CC arthritis, cancer, wounds, viral, bacterial or fungal infection. Chronic
 CC obstructive pulmonary disease (COPD) and enterocolitis (many other
 CC diseases and disorders are listed in the specification). The
 CC polymucleotides are also useful for chromosome identification. Antibodies
 CC against the proteins may be utilised for immunophenotyping of cell lines
 CC and biological samples. The present sequence is a genotyping PCR primer
 CC for the gene encoding one of the proteins listed above

XX
CC PCR primer TM6-E2 (AAT18361) is complementary to DNA coding for a region
CC corresponding to, or near, the sixth transmembrane domain of known G-
CC protein coupled receptor proteins (G-PCRs). TM6-E2 and other primers
CC (see also AAT18347-60 and AAT18362-65) based on G-PCR transmembrane
CC domains are used for the PCR amplification of mammalian DNAs to obtain G-
CC PCR-encoding sequences (see also AAT18366-73 and AAT13901-09)

CC Double-stranded cDNA was prepared from human glioblastoma mRNA and large-

CC size cDNA was ligated to EcoRI linkers. linker-ligated cDNA was then
CC ligated to the calf intestinal phosphatase-treated EcoRI site of the
CC vector Bluescript SK+. The ligated plasmid DNA was used as template in a
CC primary PCR amplification with human primers hsp661 and hsp662
CC (AAQ30789 and AAQ30790) and the vector-specific primer t3 (from
CC "Stratagene"). The primary PCR product was used as template for secondary
CC PCR with the human primer hsp663 (AAQ30791) and t3. The product of this
CC reaction was amplified in a tertiary PCR amplification with hsp664
CC (AAQ30792) and vector-specific primer SK (also from "Stratagene"). A
CC 400bp DNA fragment was detected which hybridized to human oligoprobe
CC hsp665 (AAQ30793). This fragment was subcloned and sequenced. It was
CC found to encode the C-terminal region of human NK1R sf and also contains
CC 3'UTR. (Updated on 25-MAR-2003 to correct PN field.)

PS Example 1; Page 8; 36pp; English.
XX
XX The core region of human NK1R sf was isolated by PCR and sequenced (see
CC AAQ30774-Q30778). The antisense primers hsp345, hsp541, hsp542,
CC hsp661 and hsp662 (AAQ30784-Q30788) were synthesised based on the human
CC core sequence. Human glioblastoma mRNA and each of these primers were
CC used in first strand cDNA synthesis to produce the template for a primary
CC PCR amplification. Primer hsp345 was used with 2 rat sense primers rsnrn
CC and rsnrth (AAQ30779 and AAQ30780) for the primary PCR with the same rat
CC product was then used as template for secondary PCR with the same rat
CC primers and the human antisense primer hsp344 (AAQ30783). The secondary
CC PCR product was the template for tertiary PCR amplification, again using

CC the same rat sense primers but with human antisense primer hsp3a1
CC (AAQ30782). The amplified DNA fragment hybridised to hsp3a2 (AAQ30781),
CC indicating it is not a non-specific by-product. The DNA was sequenced and
CC found to encode the human NK1R sf N-terminal region and also contains a
CC 5' UTR. (Updated on 25-MAR-2003 to correct PN field.)

PS
XX The core region of human NK1R 5' was isolated by PCR and sequenced (see
XX AAQ30774-Q30778). The antisense primers hsp3a5, hsp5a1, hsp5a2,
XX hsp6a1 and hsp6a2 (AAQ30784-Q30788) were synthesised based on the human
XX core sequence. Human glioblastoma mRNA and each of these primers were
XX used in first strand cDNA synthesis to produce the template for a primary
XX PCR amplification. Primer hsp3a5 was used with 2 rat sense primers repm
XX and repm (AAQ30779 and AAQ30780) for the primary amplification. The PCR
XX product was then used as template for secondary PCR with the same rat
XX primers and the human antisense primer hsp3a4 (AAQ30783). The secondary
XX PCR product was the template for tertiary PCR amplification, again using
XX the same rat sense primers but with human antisense primer hsp3a1
XX (AAQ30782). The amplified DNA fragment hybridised to hsp3a2 (AAQ30781),
XX indicating it is not a non-specific by-product. The DNA was sequenced and
XX found to encode the human NK1R 5' N-terminal region and also contains a
XX 5' UTR. (Updated on 25-MAR-2003 to correct PN field.)

XX PT Novel polymorphisms in the human neurokinin 1 receptor gene used for
XX PT diagnosis and treatment of NK1R ligand mediated diseases such as asthma.
XX PS Disclosure; Page 10; 43pp; English.
XX XX
XX CC This sequence represents an allele specific primer used to detect the
XX CC 2361 'T' polymorphism in exon 1 of the human neurokinin 1 receptor gene
XX CC (see AAZ92286). The invention relates to single nucleotide polymorphisms
XX CC (SNPs) in human neurokinin 1 receptor (NK1R). Detection of these
XX CC polymorphisms is useful for the diagnosis and treatment of NK1R ligand
XX CC mediated diseases. A method for the diagnosis of one or more SNPs in the
XX CC NK1R gene in a human, comprises determining the sequence of the nucleic
XX CC acid at one or more of the polymorphic positions. Diagnostic primers can
XX CC be used to detect the presence of the polymorphisms. The methods of the
XX CC invention are used to identify SNPs in the human neurokinin 1 receptor
XX CC (NK1R) gene. The presence or absence of these polymorphisms can be used
XX CC in the diagnosis and treatment of NK1R-ligand mediated diseases, such as
XX CC asthma and depression. A NK1R ligand antagonist drug can also be used to
XX CC treat pain, migraine, anxiety, depression, urinary incontinence, and
XX CC inflammatory bowel disease. The methods may also be used for the
XX CC development of new drug therapies which selectively target one or more
XX CC allelic variants of the NK1R gene

XX
XX New isolated nucleic acid with at least one polymorphic position, useful
XX for detecting, diagnosing and treating disorders such as angioedema,
XX cancer, viral, bacterial or fungal infection, cardiovascular and
XX autoimmune diseases.
XX
XX Example 3; Page 912; 977pp; English.
XX
XX The invention relates to an isolated nucleic acid from a human gene
XX encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (BDKRB1),
XX tachykinin receptor B1 (TACR1), Cl esterase inhibitor (C1NH), kallikrein
XX 1 (KLK1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme
XX 2 (ACE2) or protease inhibitor 4 (PI4), comprising at least one
XX polymorphic position. Also included are (1) a probe that hybridises to a
XX nucleotide polymorphism comprising additional 5' and 3' flanking genomic
XX sequence; (2) analysing (M1) at least one nucleic acid sample comprising
XX obtaining the sample from one or more individuals and determining the
XX nucleic acid sequence at one or more polymorphic positions in a gene
XX encoding a protein selected from the group above; (3) constructing (M2)
XX haplotypes using the genes comprising grouping at least two nucleic acids
XX (4) identifying (M3) an individual at risk of developing a disorder
XX upon administration of an ACE inhibitor and/or vasopressinase inhibitor
XX using the polymorphic data; (5) a library of nucleic acids, each of which
XX comprises one or more polymorphic positions within a gene encoding a
XX human protein selected from the group above; and (6) genotyping (M4) an
XX individual comprising obtaining a nucleic acid sample, determining the
XX nucleotide present in at least one polymorphic position, and comparing at
XX least one position with a known data set. The genes, (M1, M2, M3 and M4)
XX and compositions are useful for detecting, diagnosing, treating,
XX preventing various disorders such as angioedema and diseases which
XX involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's
XX disease, trachomas, and cardiovascular diseases like angina pectoris,
XX hypertension, heart failure, myocardial infarction, ventricular
XX hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary
XX artery disease, arteriosclerosis and/or atherosclerosis, and
XX hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory
XX arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic
XX obstructive pulmonary disease (COPD) and enterocolitis (many other
XX diseases and disorders are listed in the specification). The
XX polynucleotides are also useful for chromosome identification. Antibodies
XX against the proteins may be utilised for immunophenotyping of cell lines
XX and biological samples. The present sequence is a genotyping PCR primer
XX for the gene encoding one of the proteins listed above

XX 1 (KLK1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme
XX 2 (ACE2) or protease inhibitor 4 (PI4), comprising at least one
XX polymorphic position. Also included are (1) a probe that hybridises to a
XX nucleotide polymorphism comprising additional 5' and 3' flanking genomic
XX sequence; (2) analysing (M1) at least one nucleic acid sample comprising
XX obtaining the sample from one or more individuals and determining the
XX nucleic acid sequence at one or more polymorphic positions in a gene
XX encoding a protein selected from the group above; (3) constructing (M2)
XX haplotypes using the genes comprising grouping at least two nucleic acids
XX (4) identifying (M3) an individual at risk of developing a disorder
XX upon administration of an ACE inhibitor and/or vasopressinase inhibitor
XX using the polymorphic data; (5) a library of nucleic acids, each of which
XX comprises one or more polymorphic positions within a gene encoding a
XX human protein selected from the group above; and (6) genotyping (M4) an
XX individual comprising obtaining a nucleic acid sample, determining the

CC nucleotide present in at least one polymorphic position, and comparing at
CC last one position with a known data set. The genes, (M1, M2, M3 and M4)
CC and compositions are useful for detecting, diagnosing, treating,
CC preventing various disorders such as angioedema and diseases which
CC involve angioedema like haemangiomas, tumours, sarcomas, Cronin's
CC disease, trichomas, and cardiovascular diseases like angina pectoris,
CC hypertension, heart failure, myocardial infarction, ventricular
CC hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary
CC artery disease, arteriosclerosis and/or atherosclerosis, and
CC hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory
CC arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic
CC obstructive pulmonary disease (COPD) and enterocolitis (many other
CC diseases and disorders are listed in the specification). The
CC polynucleotides are also useful for chromosome identification. Antibodies
CC against the proteins may be utilised for immunophotyping of cell lines
CC and biological samples. The present sequence is a genotyping PCR primer
CC for the gene encoding one of the proteins listed above

PT Treating pathological condition involving neurokinin receptor-1, e.g.

PT nucleotide disruptor compound which modulate NK-1 receptor biosynthetic

PT pathway.

PS Claim 24; Page 20; 100pp; English

The invention relates to a method of treating a pathological condition

characterised partially by involvement of neurokinin receptor-1 (NK-1) receptor, especially treating, attenuating or preventing pain or inflammatory condition. The method comprises administering to a mammal, a compound chosen from an oligonucleotide, its analogue, and a disruptor which interferes with function or production of NK-1 receptors. The method is useful for treating a pathological condition characterised by involvement of NK-1 receptor such as dermatological, immune, autoimmune, cardiovascular, vascular disorders (e.g. migraines), allergy, neuropathic, psychiatric and central nervous system disorders (e.g. anxiety, psychosis, schizophrenia), gut inflammation, arthritis, and for treating, attenuating or preventing pain or inflammation such as peripheral, peripheral aspects of chronic or acute pain, and for treating, attenuating or preventing pain or inflammation such as peripheral, chronic, acute pain or inflammation, neuropathic pain, inflammation or pain relating to psychiatric disorders and central nervous system disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia in a mammal, in particular human, NK-1 receptor related disorders, diseases, or pathological conditions treatable by this method include respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic conditions (e.g. conjunctivitis), cutaneous/dermatological conditions (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and Crohn's disease), cardiovascular conditions (stroke), chronic gastrointestinal tract inflammation, and inflammatory diseases such as inflammatory bowel diseases. Other disorders and diseases include cardiovascular pathologies including stroke, chronic inflammatory diseases such as rheumatoid arthritis, demyelinating diseases such as multiple sclerosis, small cell lung cancer, depression, hypersensitivity disorders such as allergies and poison ivy, vasospastic diseases such as angina, addiction disorders such as alcoholism, neurodegenerative disorders such as acquired immune deficiency syndrome (AIDS) related dementia, epilepsy, Alzheimer's disease, and other neuro-pathological disorders, such as peripheral neuropathy, oedema, stress related and somatic disorders, and osteoarthritis. Antisense oligonucleotides effectively treat chronic conditions and other pathological states without the co-administration of substance P, and reduce the number of activated receptors while not reducing the number of quiescent NK-1 receptors. Receptors not chronically stimulated are less affected, reducing side effects of treatment. ABK6384-ABK63906 represent NK-1 receptor coding sequences and oligonucleotides of the invention

PT Treating pathological condition involving neurokinin receptor-1, e.g.
PT pain or inflammation, by administering oligonucleotide or a non-
PT nucleotide disruptor compound which modulate NK-1 receptor biosynthetic
PT pathway.
XX
PS Claim 24; Page 65; 100pp; English.
XX
XX The invention relates to a method of treating a pathological condition
XX characterised partially by involvement of neurokinin receptor-1 (NK-1)
XX receptor, especially treating, attenuating or preventing pain or
XX inflammatory condition. The method comprises administering to a mammal, a
XX compound chosen from an oligonucleotide, its analogue, and a disruptor
XX which interferes with function or production of NK-1 receptors. The
XX method is useful for treating a pathological condition characterised by
XX involvement of NK-1 receptor such as dermatological, immune, autoimmune,
XX cardiovascular, vascular disorders (e.g. migraine), airway, neuropathic,
XX psychiatric and central nervous system disorders (e.g. anxiety,
XX psychosis, schizophrenia), gut inflammation, arthritis and central or
XX peripheral aspects of chronic or acute pain, and for treating,
XX attenuating or preventing pain or inflammation such as peripheral,
XX chronic, acute pain or inflammation, neuropathic pain, inflammation or
XX pain relating to psychiatric disorders and central nervous system
XX disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia
XX in a mammal, in particular human. NK-1 receptor related disorders,
XX diseases, or pathological conditions treatable by this method include
XX respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic
XX conditions (e.g. conjunctivitis), cutaneous/dermatological conditions
XX (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and

CC Crohn's disease), cardiovascular conditions (stroke), chronic
CC gastrointestinal tract inflammation, and inflammatory diseases such as
CC inflammatory bowel diseases. Other disorders and diseases include
CC cardiovascular pathologies including stroke, chronic inflammatory
CC diseases such as rheumatoid arthritis, demyelinating diseases such as
CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity
CC disorders such as allergies and poison ivy, vasospastic diseases such as
CC angina, addiction disorders such as alcoholism, neurodegenerative
CC disorders such as acquired immune deficiency syndrome (AIDS) related
CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
CC disorders such as peripheral neuropathy, oedema, stress related and
CC somatic disorders, and osteoarthritis. Antisense oligonucleotides
CC effectively treat chronic conditions and other pathological states
CC without the co-administration of substance P, and reduce the number of
CC activated receptors while not chronically stimulating are less affected,
CC reducing side effects of treatment. ABR63834-ABR63906 represent NK-1

 Treating pathological condition involving neurokinin receptor-1, e.g. pain or inflammation, by administering oligonucleotide or a non-nucleotide disruptor compound which modulate NK-1 receptor biosynthetic pathway.
 Example 18; Page 65; 100pp; English.
 The invention relates to a method of treating a pathological condition characterised partially by involvement of neurokinin receptor-1 (NK-1) receptor, especially treating, attenuating or preventing pain or inflammatory condition. The method comprises administering to a mammal, a compound chosen from an oligonucleotide, its analogue, and a disruptor which interferes with function or production of NK-1 receptors. The method is useful for treating a pathological condition characterised by involvement of NK-1 receptor such as dermatological, immune, autoimmune, cardiovascular, vascular disorders (e.g. migraine), airway, neuropathic, psychiatric and central nervous system disorders (e.g. anxiety, psychosis, schizophrenia), gut inflammation, arthritis, and central or peripheral aspects of chronic or acute pain, and for treating, attenuating or preventing pain or inflammation such as peripheral, chronic, acute pain or inflammation, neuropathic pain, inflammation or pain relating to psychiatric disorders and central nervous system disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia in a mammal, in particular human. NK-1 receptor related disorders, diseases, or pathological conditions treatable by this method include respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic conditions (e.g. conjunctivitis), cutaneous/dermatological conditions (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and Crohn's disease), cardiovascular conditions (stroke), chronic gastrointestinal tract inflammation, and inflammatory diseases such as inflammatory bowel diseases. Other disorders and diseases include cardiovascular pathologies including stroke, chronic inflammatory diseases such as rheumatoid arthritis, demyelinating diseases such as multiple sclerosis, small cell lung cancer, depression, hypersensitivity disorders such as allergies and poison ivy, vasospastic diseases such as angina, addiction disorders such as alcoholism, neurodegenerative disorders such as acquired immune deficiency syndrome (AIDS) related dementia, epilepsy, Alzheimer's disease, and other neuro-pathological disorders such as peripheral neuropathy, oedema, stress related and somatic disorders, and osteoarthritis. Antisense oligonucleotides effectively treat chronic conditions and other pathological states without the co-administration of substance P, and reduce the number of activated receptors while not reducing the number of quiescent NK-1 receptors. Receptors not chronically stimulated are less affected, reducing side effects of treatment. ABK6334-ABK6396 represent NK-1 receptor coding sequences and oligonucleotides of the invention

 XX
 XX Claim 24; Page 65; 100pp; English.
 PS
 XX The invention relates to a method of treating a pathological condition characterised partially by involvement of neurokinin receptor-1 (NK-1) receptor, especially treating, attenuating or preventing pain or inflammatory condition. The method comprises administering to a mammal, a compound chosen from an oligonucleotide, its analogue, and a disruptor which interferes with function or production of NK-1 receptors. The method is useful for treating a pathological condition characterised by involvement of NK-1 receptor such as dermatological, immune, autoimmune, cardiovascular, vascular disorders (e.g. migraine), airway, neuropathic, psychiatric and central nervous system disorders (e.g. anxiety, psychosis, schizophrenia), gut inflammation, arthritis, and central or peripheral aspects of chronic or acute pain, and for treating, attenuating or preventing pain or inflammation such as peripheral, chronic, acute pain or inflammation, neuropathic pain, inflammation or pain relating to psychiatric disorders and central nervous system disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia in a mammal, in particular human. NK-1 receptor related disorders, diseases, or pathological conditions treatable by this method include respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic conditions (e.g. conjunctivitis), cutaneous/dermatological conditions

CC (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and
CC Crohn's disease), cardiovascular conditions (stroke), chronic
CC gastrointestinal tract inflammation, and inflammatory diseases such as
CC inflammatory bowel diseases. Other disorders and diseases include
CC cardiovascular pathologies including stroke, chronic inflammatory
CC diseases such as rheumatoid arthritis, demyelinating diseases such as
CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity
CC disorders such as allergies and poison ivy, vasospastic diseases such as
CC angina, addiction disorders such as alcoholism, neurodegenerative
CC disorders such as acquired immune deficiency syndrome (AIDS) related
CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
CC disorders such as peripheral neuropathy, edema, stress related and
CC somatic disorders, and osteoarthritis. Antisense oligonucleotides
CC effectively treat chronic conditions and other pathological states
CC without the co-administration of substance P, and reduce the number of
CC activated receptors while not reducing the number of quiescent NK-1
CC receptors. Receptors not chronically stimulated are less affected,
CC reducing side effects of treatment. ABK63834-ABK63906 represent NK-1
CC receptor coding sequences and oligonucleotides of the invention

PT polymorphic sites for diagnosing and treating asthma, and in forensics,
PT paternity testing, and genetic mapping of the traits.
XX
XX Example; Page 12; 27pp; English.
XX
XX The invention relates to a nucleic acid segment from the human neurokinin
CC 1 receptor (TACR1) gene of 10-100 nucleotides comprising a fragment
CC having a polymorphic site or a complement of the fragment. The TACR1
CC segment is useful for analysing a nucleic acid, by obtaining the nucleic
CC acid from an individual, and determining the base occupying any one of
CC the polymorphic sites in the segment. The nucleic acid is obtained from
CC several individuals, and the base occupying one of the polymorphic sites
CC is determined in each of the individuals, and further involves testing
CC each of the individuals for the presence of a disease phenotype, and
CC correlating the presence with the base. The TACR1 segment is useful for
CC diagnosing and treating TACR1 ligand mediated diseases, such as asthma.
CC The TACR1 segment is also useful in forensics, paternity testing,
CC correlating polymorphisms with phenotypic traits, and genetic mapping of
CC phenotypic traits. The TACR1 segment is useful in diagnosing and
CC monitoring of diseases such as cancer, inflammation, heart disease,
CC disorders of central nervous system, and susceptibility to infection to
CC microorganisms. The TACR1 segment is also useful in the manufacture of a
CC medicament for the treatment of the diseases. This polynucleotide
CC sequence represents a PCR primer of the human neurokinin 1 receptor
CC (TACR1) gene of the invention

CC The sequences given in AAQ297670-82, AAQ29763 and AAQ29746-48 are primers
CC which were used in the isolation of fragments of the human neurokinin-1
CC receptor (NK1R) cDNA. Human NK1R is a membrane receptor for the
CC neurotransmitter substance P. The primers were designed using regions of
CC the human NK1R cDNA and also regions of the rat NK1R which were thought
CC to be similar to human regions. Part of the human cDNA sequence was
CC derived by amplification using these primers. The remaining part of human
CC NK1R cDNA was obtained from a human cDNA library utilising portions of
CC PCR generated fragments as probes. See also AAQ29749. (Updated on 25-MAR-
CC 2003 to correct PN field.)

PT Treating pathological condition involving neurokinin receptor-1, e.g.
PT pain or inflammation, by administering oligonucleotide or a non-
PT nucleotide disruptor compound which modulate NK-1 receptor biosynthetic
PT pathway.
XX
PS Example 18; Page 65; 100pp; English.
XX
CC The invention relates to a method of treating a pathological condition
CC characterised partially by involvement of neurokinin receptor-1 (NK-1)
CC receptor, especially treating, attenuating or preventing pain or
CC inflammatory condition. The method comprises administering to a mammal, a

CC compound chosen from an oligonucleotide, its analogue, and a disruptor
CC which interferes with function or production of NK-1 receptors. The
CC method is useful for treating a pathological condition characterised by
CC involvement of NK-1 receptor such as dermatological, immune, autoimmune,
CC cardiovascular, vascular disorders (e.g. migraine), airway, neuropathic,
CC psychiatric and central nervous system disorders (e.g. anxiety,
CC psychosis, schizophrenia), gut inflammation, arthritis, and central or
CC peripheral aspects of chronic or acute pain, and for treating,
CC attenuating or preventing pain or inflammation such as peripheral,
CC chronic, acute pain or inflammation, neuropathic pain, inflammation or
CC pain relating to psychiatric disorders and central nervous system
CC disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia
CC in a mammal, in particular human. NK-1 receptor related disorders,
CC diseases, or pathological conditions treatable by this method include
CC respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic
CC conditions (e.g. conjunctivitis), cutaneous/dermatological conditions
CC (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and
CC Crohn's disease), cardiovascular conditions (stroke), chronic
CC gastrointestinal tract inflammation, and inflammatory diseases such as
CC inflammatory bowel diseases. Other disorders and diseases include
CC cardiovascular pathologies including stroke, chronic inflammatory
CC diseases such as rheumatoid arthritis, demyelinating diseases such as
CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity
CC disorders such as allergies and poison ivy, vasospastic diseases such as
CC angina, addiction disorders such as alcoholism, neurodegenerative
CC disorders such as acquired immune deficiency syndrome (AIDS) related
CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
CC disorders such as peripheral neuropathy, oedema, stress related and
CC somatic disorders, and osteoarthritis. Antisense oligonucleotides
CC effectively treat chronic conditions and other pathological states
CC without the co-administration of substance P, and reduce the number of
CC activated receptors while not reducing the number of quiescent NK-1
CC receptors. Receptors not chronically stimulated are less affected,
CC reducing side effects of treatment. ABK63824-ABK63906 represent NK-1
CC receptor coding sequences and oligonucleotides of the invention

 PT Treating pathological condition involving neurokinin receptor-1, e.g.
 PT pain or inflammation, by administering oligonucleotide or a non-
 PT nucleotide disruptor compound which modulate NK-1 receptor biosynthetic
 PT pathway.
 XX
 PS Claim 24; Page 65; 100pp; English.
 XX
 PS The invention relates to a method of treating a pathological condition
 CC characterised partially by involvement of neurokinin receptor-1 (NK-1)
 CC receptor, especially treating, attenuating or preventing pain or
 CC inflammatory condition. The method comprises administering to a mammal, a
 CC compound chosen from an oligonucleotide, its analogue, and a disruptor
 CC which interferes with function or production of NK-1 receptors. The
 CC method is useful for treating a pathological condition characterised by
 CC involvement of NK-1 receptor such as dermatological, immune, autoimmune,
 CC cardiovascular, vascular disorders (e.g. migraine), allergy, neuropathic,
 CC psychiatric and central nervous system disorders (e.g. anxiety,
 CC psychosis, schizophrenia), gut inflammation, arthritis, and central or
 CC peripheral aspects of chronic or acute pain, and for treating,
 CC attenuating or preventing pain or inflammation such as peripheral,
 CC chronic, acute pain or inflammation, neuropathic pain, inflammation or
 CC pain relating to psychiatric disorders and central nervous system
 CC disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia
 CC in a mammal, in particular human. NK-1 receptor related disorders,
 CC diseases, or pathological conditions treatable by this method include
 CC respiratory conditions (e.g. asthma, allergic rhinitis), opthalmic
 CC conditions (e.g. conjunctivitis), cutaneous/dermatological conditions
 CC (allergic dermatitis), intestinal conditions (stroke), chronic
 CC Crohn's disease), cardiovascular conditions (stroke), chronic
 CC gastrointestinal tract inflammation, and inflammatory diseases such as
 CC inflammatory bowel diseases. Other disorders and diseases include
 CC cardiovascular pathologies including stroke, chronic inflammatory
 CC diseases such as rheumatoid arthritis, demyelinating diseases such as
 CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity
 CC disorders such as allergies and poison ivy, vasospastic diseases such as
 CC angina, addiction disorders such as alcoholism, neurodegenerative
 CC disorders such as acquired immune deficiency syndrome (AIDS) related
 CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
 CC disorders such as peripheral neuropathy, oedema, stress related and
 CC somatic disorders, and osteoarthritis. Antisense oligonucleotides
 CC effectively treat chronic conditions and other pathological states
 CC without the co-administration of substance P, and reduce the number of
 CC activated receptors while not reducing the number of quiescent NK-1
 CC receptors. Receptors not chronically stimulated are less affected,
 CC reducing side effects of treatment. ABK63834-ABK63906 represent NK-1
 CC receptor coding sequences and oligonucleotides of the invention

PT Novel modified tachykinin receptors useful for removing or suppressing
PT substance P in body fluids, and treatment or prophylaxis of a condition
PT associated with substance P or other tachykinin receptor-binding ligand.
XX
XX Example 1; Page 27; 45pp; English.

XX The invention relates to a mutant tachykinin receptor in which the three
CC amino acids of the DRV sequence that occurs adjacent to the junction of
CC the TM3 domain with intracellular loop 2 are replaced with amino acids
CC whose side chains are neither lipophilic nor contain charged groups.
CC Mammalian tachykinins include substance P (SP), neurokinin A (NKA) and
CC neurokinin B (NKB). The mutant receptor of the invention is useful for
CC treatment or prevention of a condition associated with over-expression or
CC inappropriate of an endogenous tachykinin ligand, including protein and/or
CC gene therapy. It is useful as a substitute in an assay to identify and/or
CC evaluate entities that bind to the wild type tachykinin receptor, and in
CC an assay to determine the concentration of ligand in body fluids in
CC patients with arthritis, pain, migraine, anxiety, schizophrenia, asthma,
CC rheumatoid arthritis and in gastrointestinal disorders and diseases of

CC the gastrointestinal tract. Other conditions or disease states that can
CC be treated, ameliorated or prevented include, attention deficit disorder,
CC premenstrual syndrome, mania, depression, inflammation, eating disorders,
CC such as obesity, cognitive disorders, movement disorders, schizophrenic
CC disorders, sexual dysfunction, stress, Alzheimer's disease, angina,
CC multiple sclerosis, scleroderma, central nervous system (CNS) disorders
CC and other conditions where excess tachykinin peptides such as SP are
CC involved. Tachykinins have an established role in neurotransmission. The
CC current sequence represents an oligonucleotide designated sense-C, used
CC in an example from the invention for the preparation of a modified human
CC NK-1 receptor (NK-1v) by site-directed mutagenesis

Method for introducing genetic material into cells - utilises

polynucleotide function enhancer and nucleic acid free of retroviral

particles, e.g. HIV immunisation.

Example 22; Page 54; 136pp; English.

Two primers (AAO67148, AAO67149) were used to amplify a DNA segment

encoding the entire envelope region from HTLV-1/TSP and /ATK isolates.

The genetic material can then be introduced into the cells of an

individual by (a) contacting the individual's cells with a polynucleotide

function enhancer (bupivacaine) and (b) administering to the cells the

nucleic acid molecule free of retroviral particles. Nucleic acid

molecules which are delivered to cells may serve as genetic templates for

proteins that function as prophylactic and/or therapeutic immunising

agents; replacement copies of defective, missing or non-functional genes;

genetic templates for therapeutic proteins; genetic templates for

antisense molecules or as genetic templates for ribozymes. The HTLV env

target protein is useful in the immunisation against and treatment of

infection by HTLV and T-cell lymphoma. (Updated on 25-MAR-2003 to correct

PN field.)

CC The invention relates to an isolated nucleic acid from a human gene
CC encoding aminopeptidase P (XPNP2), bradykinin receptor B1 (BDKRB1),
CC tachykinin receptor B1 (TRACR1), C1 esterase inhibitor (C1NH), kallikrein
CC 1 (KLK1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme
CC 2 (ACE2) or proase inhibitor 4 (PI4), comprising at least one
CC polymorphic position. Also included are (1) a probe that hybridises to a
CC polymorphic position as provided in the detailed summary of single
CC nucleotide polymorphisms comprising additional 5' and 3' flanking genomic
CC sequence; (2) analysing (M1) at least one nucleic acid sample comprising
CC obtaining the sample from one or more individuals and determining the
CC nucleic acid sequence at one or more polymorphic positions in a gene
CC encoding a protein selected from the group above; (3) constructing (M2)
CC haplotypes using the genes comprising grouping at least two nucleic acids
CC; (4) identifying (M3) an individual at risk of developing a disorder
CC upon administration of an ACE inhibitor and/or vasopeptidase inhibitor
CC using the polymorphic data; (5) a library of nucleic acids, each of which
CC comprises one or more polymorphic positions within a gene encoding a
CC human protein selected from the group above; and (6) genotyping (M4) an
CC individual comprising obtaining a nucleic acid sample, determining the
CC nucleotide present in at least one polymorphic position, and comparing at
CC least one position with a known data set. The genes, (M1, M2, M3 and M4)
CC and compositions are useful for detecting, diagnosing, treating,
CC preventing various disorders such as angiodaema and diseases which
CC involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's
CC disease, trachomas, and cardiovascular diseases like angina pectoris,
CC hypertension, heart failure, myocardial infarction, ventricular
CC hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary
CC artery disease, arteriosclerosis and/or atherosclerosis, and
CC hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory
CC arthritis, cancer, wounds, viral, bacterial or fungal infection, chronic
CC obstructive pulmonary disease (COPD) and enterocolitis (many other
CC diseases and disorders are listed in the specification). The
CC polymorphisms are also useful for chromosome identification. Antibodies
CC against the proteins may be utilised for immunophenotyping of cell lines
CC and biological samples. The present sequence represents or contains the
CC region surrounding a single-nucleotide polymorphism in one of the genes
CC encoding one of the proteins listed above

XX The invention relates to an isolated nucleic acid from a human gene
 CC encoding aminopeptidase P (XPNPEP2), bradykinin receptor B1 (BDRB1),
 CC tachykinin receptor B1 (TACR1), C1 esterase inhibitor (C1NH), kallikrein
 CC 1 (KLK1), bradykinin receptor B2 (BDRB2), angiotensin converting enzyme
 CC 2 (ACE2) or protease inhibitor 4 (PI4), comprising at least one
 CC polymorphic position. Also included are (1) a probe that hybridises to a
 CC polymorphic position as provided in the detailed summary of single
 CC nucleotide polymorphisms comprising additional 5' and 3' flanking genomic
 CC sequence; (2) analysing (M1) at least one nucleic acid sample comprising
 CC obtaining the sample from one or more individuals and determining the
 CC nucleic acid sequence at one or more polymorphic positions in a gene
 CC encoding a protein selected from the group above; (3) constructing (M2)
 CC haplotypes using the genes comprising grouping at least two nucleic acids
 CC ; (4) identifying (M3) an individual at risk of developing a disorder
 CC upon administration of an ACE inhibitor and/or vasopressinase inhibitor
 CC using the polymorphic data; (5) a library of nucleic acids, each of which
 CC comprises one or more polymorphic positions within a gene encoding a
 CC human protein selected from the group above; and (6) genotyping (M4) an
 CC individual comprising obtaining a nucleic acid sample, determining the
 CC nucleotide present in at least one polymorphic position, and comparing at
 CC least one position with a known data set. The genes, (M1, M2, M3 and M4)

 PT Treating pathological condition involving neurokinin receptor-1, e.g.
 PT pain or inflammation, by administering oligonucleotide or a non-
 PT nucleotide disruptor compound which modulate NK-1 receptor biosynthetic

PT pathway.
XX
XX Example 18; Page 65; 100pp; English.
XX
XX The invention relates to a method of treating a pathological condition
CC characterised partially by involvement of neurokinin receptor-1 (NK-1)
CC receptor, especially treating, attenuating or preventing pain or
CC inflammatory condition. The method comprises administering to a mammal, a
CC compound chosen from an oligonucleotide, its analogue, and a disruptor
CC which interferes with function or production of NK-1 receptors. The
CC method is useful for treating a pathological condition characterised by
CC involvement of NK-1 receptor such as dermatological, immune, autoimmune,
CC cardiovascular, vascular disorders (e.g. migraine), allergy, neuropathic,
CC psychiatric and central nervous system disorders (e.g. anxiety,
CC psychosis, schizophrenia), gut inflammation, arthritis, and central or
CC peripheral aspects of chronic or acute pain, and for treating,
CC attenuating or preventing pain or inflammation such as peripheral,
CC chronic, acute pain or inflammation, neuropathic pain, inflammation or
CC pain relating to psychiatric disorders and central nervous system
CC disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia
CC in a mammal, in particular human. NK-1 receptor related disorders,
CC diseases, or pathological conditions treatable by this method include
CC respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic
CC conditions (e.g. conjunctivitis), cutaneous/dermatological conditions
CC (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and
CC Crohn's disease), cardiovascular conditions (stroke), chronic
CC gastrointestinal tract inflammation, and inflammatory diseases such as
CC inflammatory bowel diseases. Other disorders and diseases include
CC cardiovascular pathologies including stroke, chronic inflammatory
CC diseases such as rheumatoid arthritis, demyelinating diseases such as
CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity
CC disorders such as allergies and poison ivy, vasospastic diseases such as
CC angina, addiction disorders such as alcoholism, neurodegenerative
CC disorders such as acquired immune deficiency syndrome (AIDS) related
CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
CC disorders such as peripheral neuropathy, oedema, stress related and
CC somatic disorders, and osteoarthritis. Antisense oligonucleotides
CC effectively treat chronic conditions and other pathological states
CC without the co-administration of substance P, and reduce the number of
CC activated receptors while not reducing the number of quiescent NK-1
CC receptors. Receptors not chronically stimulated are less affected,
CC reducing side effects of treatment. ABK63834-ABK63906 represent NK-1
CC receptor coding sequences and oligonucleotides of the invention

PT pathway.
XX
XX Claim 24; Page 20; 100pp; English.
PS
XX The invention relates to a method of treating a pathological condition
CC characterised partially by involvement of neurokinin receptor-1 (NK-1)
CC receptor, especially treating, attenuating or preventing pain or
CC inflammatory condition. The method comprises administering to a mammal, a
CC compound chosen from an oligonucleotide, its analogue, and a disruptor
CC which interferes with function or production of NK-1 receptors. The

CC method is useful for treating a pathological condition characterised by
CC involvement of NK-1 receptor such as dermatological, immune, autoimmune,
CC cardiovascular, vascular disorders (e.g. migraine), airway, neuropathic,
CC psychiatric and central nervous system disorders (e.g. anxiety,
CC psychosis, schizophrenia), gut inflammation, arthritis, and central or
CC peripheral aspects of chronic or acute pain, and for treating,
CC attenuating or preventing pain or inflammation such as peripheral,
CC chronic, acute pain or inflammation, neuropathic pain, inflammation or
CC pain relating to psychiatric disorders and central nervous system
CC disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia
CC in a mammal, in particular human. NK-1 receptor related disorders,
CC diseases, or pathological conditions treatable by this method include
CC respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic
CC conditions (e.g. conjunctivitis), cutaneous/dermatological conditions
CC (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and
CC Crohn's disease), cardiovascular conditions (stroke), chronic
CC gastrointestinal tract inflammation, and inflammatory diseases such as
CC inflammatory bowel diseases. Other disorders and diseases include
CC cardiovascular pathologies including stroke, chronic inflammatory
CC diseases such as rheumatoid arthritis, demyelinating diseases such as
CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity
CC disorders such as allergies and poison ivy, vasospastic diseases such as
CC angina, addiction disorders such as alcoholism, neurodegenerative
CC disorders such as acquired immune deficiency syndrome (AIDS) related
CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
CC disorders such as peripheral neuropathy, oedema, stress related and
CC somatic disorders, and osteoarthritis. Antisense oligonucleotides
CC effectively treat chronic conditions and other pathological states
CC without the co-administration of substance P, and reduce the number of
CC activated receptors while not reducing the number of quiescent NK-1
CC receptors. Receptors not chronically stimulated are less affected,

XX Inducing differentiation of undifferentiated mammalian cells into
PT osteoblasts, for treating e.g. osteoporosis, by contacting the cell with
PT an expression or translation inhibitory agent for a polyribonucleotide
PT encoding a polypeptide.
XX
XX Claim 9; SEQ ID NO 52; 88pp; English.
PS
XX The invention relates to a method of inducing differentiation of
CC undifferentiated mammalian cells into osteoblasts comprising inhibiting
CC the biological activity of a polypeptide, its fragments and/or
CC derivatives, comprising contacting the cell with an expression or
CC translation inhibitory agent that inhibits the expression or translation
CC in the cell of a polyribonucleotide encoding the polypeptide. The
CC invention also relates to a method of identifying a compound that induces
CC differentiation of undifferentiated mammalian cells into osteoblasts, a
CC vector comprising a nucleotide sequence of the invention, in vitro
CC production of bone tissue, osteoblast cells obtainable by the method and
CC a method of diagnosing a pathological condition involving a systemic or
CC local decrease in mean bone density or a susceptibility to the condition
CC in a subject. In the method above, the expression inhibitory agent is
CC selected from antisense RNA, a nucleic acid expressing the antisense RNA,
CC a ribozyme that cleaves the polyribonucleotide, an antisense
CC oligodeoxynucleotide, a small interfering RNA (siRNA) that is
CC sufficiently homologous to a portion of the polyribonucleotide such that
CC the siRNA is capable of inhibiting the polyribonucleotide that would
CC otherwise cause the production of the polypeptide, and an antibody
CC reactive to the polypeptide. The osteoblast cells are useful for in vitro

CC production of bone tissue. The polynucleotide or the vector is useful as
 CC a medicament or for manufacturing a medicament for the treatment of a
 CC disease involving a systemic or local decrease in mean bone density,
 CC selected from osteoporosis, hypercalcaemia, multiple myeloma,
 CC hyperparathyroidism and hyperthyroidism. The method is useful for
 CC inducing differentiation of undifferentiated mammalian cells into
 CC osteoblasts. This sequence represents a human siRNA molecule of the
 CC invention.

 PT Inducing differentiation of undifferentiated mammalian cells into
 PT osteoblasts, comprises contacting undifferentiated cells with inhibitors
 PT of polypeptides of isolated knock-down constructs and corresponding
 PT target gene sequences.

PS Claim 8; SEQ ID NO 53; 98bp; English.
 XX
 XX The invention relates to inducing differentiation of undifferentiated
 CC mammalian cells into osteoblasts, comprising contacting the
 CC undifferentiated cells with an inhibitor of any of the 220 polypeptides
 CC given in the specification (table 4 for overview of isolated knock-down
 CC constructs and corresponding target gene sequences), their fragments
 CC and/or derivatives. Also included are identifying a compound that induces
 CC differentiation of undifferentiated mammalian cells into osteoblasts
 CC (comprising contacting one or more compounds with a polypeptide listed in
 CC table 4 of the specification, encoded by any of the genes listed in table
 CC 4 of the specification, and/or their fragments and/or derivatives,
 CC determining the binding affinity of the compound to the polypeptide,
 CC contacting a population of undifferentiated mammalian cells with the
 CC compound that exhibits a binding affinity of at least 10 micromolar and
 CC identifying the compound that induces the differentiation of the

CC undifferentiated mammalian cells), identifying a compound or mixture of
 CC compounds that induces differentiation of undifferentiated mammalian
 CC cells into osteoblasts, a polynucleotide comprising a sequence of 17-23
 CC nucleotides homologous to a nucleotide sequence of the target genes
 CC listed in table 4 of the specification, a vector comprising a
 CC polynucleotide comprising a sequence of 17-23 nucleotides, in vitro
 CC production of bone tissue (comprising applying undifferentiated mammalian
 CC cells on a substrate to form a cellular substrate, introducing a
 CC polynucleotide comprising a sequence of 17-23 nucleotides or a vector
 CC comprising the polynucleotide to differentiate the undifferentiated cells
 CC into osteoblasts, to produce a continuous bone matrix), diagnosing a
 CC pathological condition involving a systemic or local decrease in mean
 CC bone density (or a susceptibility to the condition) in a subject (
 CC comprising determining the level of expression of a polynucleotide
 CC encoded by any of the target genes (listed in table 4 of the
 CC specification) in a biological sample and comparing the level of
 CC expression with the level of expression of the polynucleotides in a
 CC sample derived from a healthy subject, and diagnosing a pathological
 CC condition involving a systemic or local decrease in mean bone density (or
 CC a susceptibility to the condition) comprising determining the amount of
 CC polypeptide encoded by the genes. The method is useful for inducing
 CC differentiation of undifferentiated mammalian cells into osteoblasts. The
 CC vector comprising the polynucleotide is useful in medicaments for the
 CC treatment of diseases involving a systemic or local decrease in mean bone
 CC density. The method is useful for in vitro production of bone tissue and
 CC osteoblast cells, and for diagnosing a pathological condition involving a
 CC systemic or local decrease in mean bone density or a susceptibility to
 CC the condition (e.g. osteoporosis, musculoskeletal disease, Paget's
 CC disease, bone disease, rheumatoid arthritis, periodontal disease,
 CC Crohn's syndrome, rickets, opsismodysplasia, pyonodysostosis, Toulouse-
 CC Lautrec syndrome and osteogenesis). The present sequence is a siRNA
 CC (short interfering RNA) that targets the mRNA of a gene listed in table 4
 CC or 5 of the specification (genes which, when their expression is reduced,
 CC promote differentiation into osteoblasts). NOTE: The present sequence is
 CC described as an siRNA but appears as a DNA sequence.

 XX respiratory, or neurological, comprises contacting a test compound with a
 XX tachykinin receptor 1.
 PS
 XX Example 2; SEQ ID NO 4; 118bp; English.
 CC The invention relates to a method of screening for therapeutic agents
 CC useful for treating a disease, comprising contacting a test compound with
 CC a tachykinin receptor 1 (TACR1) polypeptide or polynucleotide, detecting
 CC binding of the polypeptide or polynucleotide, determining the activity of
 CC TACR1 at a certain concentration of the test compound, in the absence of
 CC the compound or in the presence of a known regulator of the TACR1
 CC polypeptide. The invention also relates to a method of diagnosing a
 CC disease in a mammal comprising determining the amount of a TACR1
 CC polynucleotide in a sample taken from the mammal and/or diseased mammals, a
 CC amount of TACR1 polynucleotide in healthy and/or diseased mammals, a
 CC pharmaceutical composition for treating diseases in a mammal comprising a
 CC TACR1 polynucleotide or polypeptide or a therapeutic agent which binds to
 CC or regulates the activity of a TACR1 polypeptide, and preparing a
 CC pharmaceutical composition useful for treating diseases in a mammal. The
 CC disease is chosen from cardiovascular diseases, infections, cancer, inflammation,
 CC dermatological diseases, gastrointestinal diseases, cancer, inflammation,
 CC metabolic disorders, hematological diseases, respiratory diseases,
 CC musculoskeletal diseases, neurological diseases, gynecological disorders
 CC and genitourinary diseases. This sequence represents a PCR primer used in
 CC expression profiling of the human TACR1 cDNA of the invention.

 XX (DRD2) gene.
 PT
 XX Claim 31; SEQ ID NO 1320; 634bp; English.
 PS
 XX The invention relates to a method of identifying a genetic profile
 XX associated with a neurological, psychiatric or psychological condition,
 XX phenotype or state including a sub-threshold neurological, psychiatric or
 XX psychological condition, phenotype or state in an individual, comprising
 XX screening individuals for a polymorphism in a genetic locus comprising
 XX the dopamine receptor D2 (DRD2) gene. The invention also relates to a
 XX genetic mutation providing a genetic marker for a neurological,
 XX psychiatric, or psychological condition, state or phenotype in an
 XX individual, where the presence of a 957C polymorphism is indicative of a
 XX predisposition to developing a neurological, psychiatric or psychological
 XX condition, phenotype or state. The compositions and methods are useful
 XX for identifying a genetic profile associated with a neurological,
 XX psychiatric or psychological condition. The method enables clinicians to
 XX make a genetic-based diagnosis of a neurological, psychiatric or
 XX psychological condition and can thereby implement treatment or
 XX preventative or symptom-ameliorating protocols to reduce the adverse
 XX consequences of the condition. This sequence represents a human dopamine
 XX receptor D2 (DRD2) DNA oligonucleotide used in the scope of the
 XX invention.

XX
PT Identifying genetic profile associated with a neurological, psychiatric,
PT or psychological condition, comprises screening individuals for a
PT polymorphism in a genetic locus comprising the dopamine receptor D2
PT (DRD2) gene.
XX
PS Claim 31; SEQ ID NO 1321; 634pp; English.
XX
CC The invention relates to a method of identifying a genetic profile
CC associated with a neurological, psychiatric or psychological condition,
CC phenotype or state including a sub-threshold neurological, psychiatric or
CC psychological condition, phenotype or state in an individual, comprising
CC screening individuals for a polymorphism in a genetic locus comprising
CC the dopamine receptor D2 (DRD2) gene. The invention also relates to a
CC genetic mutation providing a genetic marker for a neurological,
CC psychiatric, or psychological condition, state or phenotype in an
CC individual, where the presence of a 957C polymorphism is indicative of a
CC predisposition to developing a neurological, psychiatric or psychological
CC condition, phenotype or state. The compositions and methods are useful
CC for identifying a genetic profile associated with a neurological,
CC psychiatric or psychological condition. The method enables clinicians to
CC make a genetic-based diagnosis of a neurological, psychiatric or
CC psychological condition and can thereby implement treatment or
CC preventative or symptom-ameliorating protocols to reduce the adverse
CC consequences of the condition. This sequence represents a human dopamine
CC receptor D2 (DRD2) DNA oligonucleotide used in the scope of the
CC invention.

PT Prodn. of double stranded cDNA immobilised support - by binding

PT polynucleotide with sequence complementary to poly-adenylic acid tail of
PT mRNA to insol. support.
XX
XX Example 3; Page 26; 54pp; English.
XX
XX A polynucleotide is immobilised on an insoluble solid support and used to
CC synthesise de-cDNA, ss-cDNA and both sense and antisense mRNA. The
CC advantage of this system is that RNA bound to the solid support need not
CC be precipitated when changing solutions. Two primers were used to amplify
CC tachykinin receptor specific mRNA after its synthesis using the above
CC method (AAQ47254, AAQ47255). (Updated on 25-MAR-2003 to correct PN
CC field.)

XX Isolation and identifying new receptor DNA - pref. G-protein linked
PT receptors, using PCR with new receptor specific primers.
XX
XX Claim 2; Fig 2A; 17pp; English.
XX
XX Consensus sequences are identified from nine rat gene receptors. The
CC receptors are for somatostatin, substance K, substance P, neuropeptide Y,
CC thyrotropin, HH/CG and others designated mas, mrg and rta. Four regions
CC of nucleotide sequence are found to exhibit a degree of conservation
CC significant enough to design degenerate oligo primers for PCR (see
CC AAQ55045-49). Five oligos are designed with 4- to 64-fold direct
CC degeneracy plus 5'-23% inosines. The oligos are designed to anneal
CC sequences in G protein-linked peptide receptor genes. They are used as
CC six different primer pairs for PCR using rat genomic DNA as template. All
CC six reactions produce DNA fragments of the expected size. Nucleotide
CC sequences of two of these fragments are given in AAQ55054 and AAQ55055.

CC Double-stranded cDNA was prepared from human glioblastoma mRNA and large-
CC size cDNA was ligated to EcoRI linkers. Linker-ligated cDNA was then
CC ligated to the calf intestinal phosphatase-treated EcoRI site of the
CC vector Bluescript SK+. The ligated plasmid DNA was used as template in a
CC primary PCR amplification with human primers hsp65l and hsp652
CC (AAQ30789 and AAQ30790) and the vector-specific primer t3 (from
CC "Stratagene"). The primary PCR product was used as template for secondary
CC PCR with the human primer hsp653 (AAQ30791) and t3. The product of this
CC reaction was amplified in a tertiary PCR amplification with hsp654
CC (AAQ30792) and vector-specific primer SK (also from "Stratagene"). A
CC 400bp DNA fragment was detected which hybridised to human oligoprobe
CC hsp655 (AAQ30793). This fragment was subcloned and sequenced. It was
CC found to encode the C-terminal region of human NKIR sf and also contains
CC 3'UTR. (Updated on 25-MAR-2003 to correct PN field.)

PS Disclosure; Page 8; 35pp; English.
XX

XX The sequences given in AAQ29670-82, AAQ29783 and AAQ29746-48 are primers
CC which were used in the isolation of fragments of the human neurokinin-1
CC receptor (NKIR) cDNA. Human NKIR is a membrane receptor for the
CC neurotransmitter substance P. The primers were designed using regions of
CC the human NKIR cDNA and also regions of the rat NKIR which were thought
CC to be similar to human regions. Part of the human cDNA sequence was
CC derived by amplification using these primers. The remaining part of human
CC NKIR cDNA was obtained from a human cDNA library utilising portions of
CC PCR generated fragments as probes. See also AAQ29749. (Updated on 25-MAR-

PT Treatment of airway diseases such as asthma - by topically applying
PT adenosine-free antisense oligonucleotide to airway epithelium of
PT subject.
XX
XX Example 5; Page 40; 71pp; English.
PS
XX A method for treating airway disease in a subject has been produced,
CC which involves the topical administration of an essentially adenosine
CC free antisense oligonucleotide (ON) to the airway epithelium of the
CC subject. The present sequence is an antisense oligonucleotide specific
CC for the substance P receptor. The method can be used to treat airway
CC diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary
CC disease, bronchitis and other airway diseases characterised by an
CC inflammatory response. By eliminating adenosine from the antisense ON,
CC its liberation upon antisense degradation is prevented, thereby
CC preventing adenosine-induced bronchoconstriction in patients with hyper-
CC reactive airways

PS
XX
XX The specification describes antisense oligonucleotides (AA52869-X55271)
CC directed against at least 2 mRNAs selected from target genes, coding and
CC non-coding regions of RNAs corresponding to target genes, gene initiation
CC codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-
CC end and the juxta-section between coding and non-coding regions and all
CC segments of RNAs encoding proteins associated with one or more diseases,
CC conditions or mixtures. The antisense oligonucleotides may be derived
CC from sequences AA55272-74. These multiple target oligonucleotides
CC (specifically AA55180-271) can be used for the antisense treatment of
CC diseases and conditions. Typical diseases and conditions are those
CC associated with impaired respiration and inflammation, including lung
CC diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC acute asthma, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
CC disease (COPD), and cancers such as leukemia, lymphomas, carcinomas e.g.
CC colon cancer, breast cancer, lung cancer, pancreatic cancer,
CC hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
CC well as all types of cancers which may metastasize or have metastasized
CC to the lungs, including breast and prostate cancer

XX PT bronchitis, emphysema, respiratory distress syndrome, ischemia or
XX PT cancers.
XX PS
XX Claim 18; Page 436; 1343pp; English.
XX
XX The present invention describes a new composition comprising an antisense
XX CC oligonucleotide (ON) with low adenosine (up to 15%), which targets
XX CC nucleic acids involved in bronchoconstriction, allergies, and/or
XX CC inflammation. The ON can have antiinflammatory, antiallergic,
XX CC antiasthmatic, cytostatic and analgesic activities. The compositions are
XX CC useful for the treatment of diseases associated with inflammation
XX CC impaired airways, including lung disease and diseases whose secondary
XX CC effects afflict the lungs of a subject. They can be used for treating
XX CC e.g. ischemic conditions, pulmonary vasoconstriction, allergies, asthma,
XX CC e.g. ischemic conditions, respiratory distress syndrome, pain, cystic
XX CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive
XX CC pulmonary disease (COPD), and cancers such as leukemias, lymphomas,
XX CC carcinomas, and cancers which may metastasize to the lungs, including
XX CC breast and prostate cancer. The reduction of the adenine content of the
XX CC ON reduces side effects. The A-containing ONs break down with the
XX CC release of deoxyadenosine which activates adenosine receptors causing the
XX CC bronchoconstriction and inflammation. AAA32313 to AAA5312 represent the
XX CC nucleotide sequences given in the sequence listing from the present
XX CC invention, which correspond to SEQ ID NO:1 to 185, and then the last 185
XX CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ
XX CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
XX CC AAA33992) are specifically claimed ONs from the present invention. N.B.
XX CC Sequences given in the disclosure of the present invention do not match
XX CC up with their corresponding SEQ ID NO: sequences given in the sequence
XX CC listing

 PT Treating pathological condition involving neurokinin receptor-1, e.g.
 PT pain or inflammation, by administering oligonucleotide or a non-
 PT nucleotide disruptor compound which modulate NK-1 receptor biosynthetic
 PT pathway.
 XX
 PS Example 18; Page 66; 100pp; English.
 XX
 CC The invention relates to a method of treating a pathological condition
 CC characterised partially by involvement of neurokinin receptor-1 (NK-1)
 CC receptor, especially treating, attenuating or preventing pain or
 CC inflammatory condition. The method comprises administering to a mammal, a
 CC compound chosen from an oligonucleotide, its analogue, and a disruptor
 CC which interferes with function or production of NK-1 receptors. The
 CC method is useful for treating a pathological condition characterised by
 CC involvement of NK-1 receptor such as dermatological, immune, autoimmune,
 CC cardiovascular, vascular disorders (e.g. migraine), airway, neuropathic,
 CC psychiatric and central nervous system disorders (e.g. anxiety,
 CC psychosis, schizophrenia), gut inflammation, arthritis, and central or
 CC peripheral aspects of chronic or acute pain, and for treating,
 CC attenuating or preventing pain or inflammation such as peripheral,
 CC chronic, acute pain or inflammation, neuropathic pain, inflammation or
 CC pain relating to psychiatric disorders and central nervous system
 CC disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia
 CC in a mammal, in particular human. NK-1 receptor related disorders,
 CC diseases, or pathological conditions treatable by this method include
 CC respiratory conditions (e.g. asthma, allergic rhinitis), ocular
 CC conditions (e.g. conjunctivitis), cutaneous/dermatological conditions
 CC (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and
 CC Crohn's disease), cardiovascular conditions (stroke), chronic
 CC gastrointestinal tract inflammation, and inflammatory diseases such as
 CC inflammatory bowel diseases. Other disorders and diseases include
 CC cardiovascular pathologies including stroke, chronic inflammatory
 CC diseases such as rheumatoid arthritis, demyelinating diseases such as
 CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity
 CC disorders such as allergies and poison ivy, vasospastic diseases such as
 CC angina, addiction disorders such as alcoholism, neurodegenerative
 CC disorders such as acquired immune deficiency syndrome (AIDS) related
 CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
 CC disorders such as peripheral neuropathy, oedema, stress related and
 CC somatic disorders, and osteoarthritis. Antisense oligonucleotides
 CC effectively treat chronic conditions and other pathological states
 CC without the co-administration of substance P, and reduce the number of
 CC activated receptors while not reducing the number of quiescent NK-1

CC receptors. Receptors not chronically stimulated are less affected.
 CC reducing side effects of treatment. ABK63874-ABK63906 represent NK-1

 PT Treating pathological condition involving neurokinin receptor-1, e.g.
 PT pain or inflammation, by administering oligonucleotide or a non-
 PT nucleotide disruptor compound which modulate NK-1 receptor biosynthetic
 PT pathway.
 XX
 PS Claim 24; Page 20; 100pp; English.
 XX
 CC The invention relates to a method of treating a pathological condition
 CC characterised partially by involvement of neurokinin receptor-1 (NK-1)
 CC receptor, especially treating, attenuating or preventing pain or
 CC inflammatory condition. The method comprises administering to a mammal, a
 CC compound chosen from an oligonucleotide, its analogue, and a disruptor
 CC which interferes with function or production of NK-1 receptors. The
 CC method is useful for treating a pathological condition characterised by
 CC involvement of NK-1 receptor such as dermatological, immune, autoimmune,
 CC cardiovascular, vascular disorders (e.g. migraine), airway, neuropathic,
 CC psychiatric and central nervous system disorders (e.g. anxiety,
 CC psychosis, schizophrenia), gut inflammation, arthritis, and central or
 CC peripheral aspects of chronic or acute pain, and for treating,
 CC attenuating or preventing pain or inflammation such as peripheral,
 CC chronic, acute pain or inflammation, neuropathic pain, inflammation or
 CC pain relating to psychiatric disorders and central nervous system

disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia
 CC in a mammal, in particular human. NK-1 receptor related disorders,
 CC diseases, or pathological conditions treatable by this method include
 CC respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic
 CC conditions (e.g. conjunctivitis), cutaneous/dermatological conditions
 CC (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and
 CC Crohn's disease), cardiovascular conditions (stroke), chronic
 CC gastrointestinal tract inflammation, and inflammatory diseases such as
 CC inflammatory bowel diseases. Other disorders and diseases include
 CC cardiovascular pathologies including stroke, chronic inflammatory
 CC diseases such as rheumatoid arthritis, demyelinating diseases such as
 CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity
 CC disorders such as allergies and poison ivy, vasospastic diseases such as
 CC angina, addiction disorders such as alcoholism, neurodegenerative
 CC disorders such as acquired immune deficiency syndrome (AIDS) related
 CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
 CC disorders such as peripheral neuropathy, oedema, stress related and
 CC somatic disorders, and osteoarthritis. Antisense oligonucleotides
 CC effectively treat chronic conditions and other pathological states
 CC without the co-administration of substance P, and reduce the number of
 CC activated receptors while not reducing the number of quiescent NK-1
 CC receptors. Receptors not chronically stimulated are less affected.

PT Novel nucleic acid segment from human neurokinin 1 receptor, including
 PT polymorphic sites for diagnosing and treating asthma, and in forensics,
 PT paternity testing, and genetic mapping of the traits.

PS Example; Page 12; 27pp; English.

XX The invention relates to a nucleic acid segment from the human neurokinin
 CC 1 receptor (TACR1) gene of 10-100 nucleotides comprising a fragment
 CC having a polymorphic site or a complement of the fragment. The TACR1
 CC segment is useful for analysing a nucleic acid, by obtaining any one of
 CC acid from an individual, and determining the base occupying any one of
 CC the polymorphic sites in the segment. The nucleic acid is obtained from
 CC several individuals, and the base occupying one of the polymorphic sites
 CC is determined in each of the individuals, and further involves testing
 CC each of the individuals for the presence of a disease phenotype, and
 CC correlating the presence with the base. The TACR1 segment is useful for
 CC diagnosing and treating TACR1 ligand mediated diseases, such as asthma.
 CC The TACR1 segment is also useful in forensics, paternity testing,
 CC correlating polymorphisms with phenotypic traits, and genetic mapping of
 CC phenotypic traits. The TACR1 segment is useful in diagnosing and
 CC monitoring of diseases such as cancer, inflammation, heart disease,
 CC diseases of central nervous system, and susceptibility to infection to
 CC microorganisms. The TACR1 segment is also useful in the manufacture of a
 CC medicament for the treatment of the diseases. This polynucleotide
 CC sequence represents a PCR primer of the human neurokinin 1 receptor
 CC (TACR1) gene of the invention

PT Pharmaceutical composition for treating ailments associated with impaired
 PT respiration, has oligo(s) antisense to specific gene(s) or its
 PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
 PT ubiquitine.

PS Disclosure; SEQ ID NO 10741; 872pp; English.

XX The invention relates to a novel pharmaceutical composition, which has a
CC first active agent comprising an oligonucleotide antisense to the
CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
CC junctions of genes encoding a polypeptide associated with lung and/or
CC nasal airway dysfunction and a second active agent comprising an
CC antiinflammatory steroid and ubiquinone. A composition of the invention
CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
CC immunosuppressive, and cytostatic activity. The composition may have a
CC use in antisense gene therapy. The composition is useful for treating or
CC preventing a respiratory, lung or malignant disease or condition, also
CC for enhancing the prophylactic or therapeutic respiratory effect of an
CC antiinflammatory steroid in a subject, for reducing or depleting levels
CC of, or reducing sensitivity to, adenosine, reducing levels of adenosine
CC receptor, producing bronchodilation, increasing levels of ubiquinone or
CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
CC lung inflammation, lung allergies, or a respiratory disease or condition.
CC Note: The sequence data for this patent is not represented in the printed
CC specification, but was obtained in electronic format directly from WIPO

XX
XX Pharmaceutical composition for treating asthma, has antisense
PT oligonucleotide containing less percentage of adenosine, targeted to
PT nucleic acids associated with lung airway or lung dysfunction, and
PT bronchodilating agent.

XX Claim 15; SEQ ID NO 10741; 763pp; English.
PS
XX This invention describes a novel composition (a) a first active agent,
XX comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, allergies and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

XX
XX New isolated nucleic acid with at least one polymorphic position, useful
PT for detecting, diagnosing and treating disorders such as angioedema,
PT cancer, viral, bacterial or fungal infection, cardiovascular and
PT autoimmune diseases.

Example 3; Page 931; 977pp; English.

The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (XPNPEP2), bradykinin receptor B1 (BDKBR1), tachykinin receptor B1 (TACR1), C1 esterase inhibitor (C1NH), kallikrein 1 (KLK1), bradykinin receptor B2 (BDKBR2), angiotensin converting enzyme 2 (ACE2) or protease inhibitor 4 (PI4), comprising at least one polymorphic position. Also included are (1) a probe that hybridises to a polymorphic position as provided in the detailed summary of single nucleotide polymorphisms comprising additional 5' and 3' flanking genomic sequence; (2) analysing (M1) at least one nucleic acid sample comprising obtaining the sample from one or more individuals and determining the nucleic acid sequence at one or more polymorphic positions in a gene encoding a protein selected from the group above; (3) constructing (M2) haplotypes using the genes comprising grouping at least two nucleic acids; (4) identifying (M3) an individual at risk of developing a disorder upon administration of an ACE inhibitor and/or vasopressinase inhibitor using the polymorphic data; (5) a library of nucleic acids, each of which comprises one or more polymorphic positions within a gene encoding a human protein selected from the group above; and (6) genotyping (M4) an individual comprising obtaining a nucleic acid sample, determining the nucleotide present in at least one polymorphic position, and comparing at least one position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, preventing various disorders such as angioedema and diseases which involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's disease, trachomas, and cardiovascular diseases like angina pectoris, hypertension, heart failure, myocardial infarction, ventricular hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary artery disease, arteriosclerosis and/or atherosclerosis, and hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease (COPD) and enterocolitis (many other diseases and disorders are listed in the specification). The polymucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is a genotyping PCR primer for the gene encoding one of the proteins listed above, using the method of automated genetic bit analysis, GBA

PT Identifying an agent that modulates ChemR23 polypeptide using TIG2 gene
PT useful for the preparation of a medicament for the treatment of
PT disorders, such as cancer, inflammatory and autoimmune diseases,
PT osteoporosis and psoriasis.

PS Example 10; Page 60; 99pp; English.

CC The invention relates to a novel method for identifying an agent that
CC modulates the function of an orphan G-protein coupled receptor, ChemR23.
CC The identification comprises contacting a ChemR23 polypeptide with a
CC tazarotene-induced gene 2 (TIG2) polypeptide in the presence and absence
CC of a candidate modulator to permit the binding of the TIG2 polypeptide to
CC the ChemR23 polypeptide, and measuring the binding of the ChemR23 to the
CC TIG2 polypeptide, where a decrease in the presence of the candidate
CC modulator, identifies the modulator as an agent that modulates the
CC function of ChemR23. The agent or composition is useful for the
CC preparation of a medicament for the treatment of a ChemR23- or TIG2-
CC related disease or disorder, such as cancer, tumour metastasis,
CC inflammatory disease, autoimmune disease, inherited or acquired immune
CC deficiencies, osteoporosis, bone healing, bone tissue grafts, graft
CC rejection, psoriasis, eczema, inflammatory infection, trophic diseases of
CC skin, viral, bacterial and parasitic infections, female infertility and
CC ovarian and uterine tumours. The truncated or full-length TIG2
CC polypeptide is useful for the production of a composition of an isolated
CC ChemR23 or TIG2 polypeptide, and/or for the production of a kit for
CC screening agents that modulate the signalling of ChemR23, and/or ligand
CC for ChemR23. This sequence represents a PCR primer used in the
CC exemplification of the invention

 XX New Chemerin polypeptides, useful for diagnosing and treating a disease,
 PT e.g. neoplasms, hypergammaglobulinemia, paraproteinemia, purpura,
 PT sarcoidosis, Sezary Syndrome, Waldenstrom's Macroglobulinemia, Gaucher's
 PT disease, or histiocytosis.
 XX
 XX Example 6; SEQ ID NO 38; 183bp; English.
 PS
 XX The invention describes a polypeptide (I) of up to 50 amino acids where
 XX the polypeptide binds specifically to a chemerin polypeptide. Also
 CC described are: a nucleic acid sequence encoding (I); an expression vector
 CC comprising the coding sequence of the nucleic acid; a transgenic animal
 CC transfected with the expression vector; a (therapeutic) composition
 CC comprising (I) and an isolated Chemerin polypeptide or a nucleic acid
 CC sequence of (I); an antibody that selectively binds to (I); identifying
 CC an agent that modulates the interaction between a Chemerin polypeptide and
 CC a Chemerin polypeptide; detecting the presence, in a sample, of an
 CC agent that modulates the interaction between a Chemerin polypeptide and a
 CC Chemerin polypeptide; in a sample; identifying an agent that modulates
 CC the function of Chemerin polypeptide; detecting the presence, in a
 CC sample, of an agent that modulates the function of Chemerin polypeptide;
 CC diagnosing a disease or disorder characterized by dysregulation of
 CC chemerin (polypeptide) signaling; a kit, for screening agents that
 CC modulate the signaling activity of Chemerin polypeptide or for
 CC diagnosing a disease or disorder characterized by dysregulation of
 CC Chemerin polypeptide signaling, comprising an isolated Chemerin
 CC polypeptide, (I), an isolated polynucleotide encoding (I), a cell
 CC transfected with a polynucleotide encoding (I), and its packaging
 CC materials; a non-human mammal transgenic for a Chemerin polynucleotide
 CC encoding (I); identifying an antibody inhibiting Chemerin activation;
 CC and an in vitro method of inhibiting cell proliferation. The
 CC (therapeutic) composition or expression vector is useful for preparing a
 CC medicament for ex vivo gene therapy or for in vivo gene therapy or a
 CC medicament for inhibiting cell proliferation, where the medicament is
 CC used for treating a disease, e.g. neoplasms, hypergammaglobulinemia,
 CC lymphoproliferative diseases, disorders, and/or conditions,
 CC paraproteinemia, purpura, sarcoidosis, Sezary Syndrome, Waldenstrom's
 CC Macroglobulinemia, Gaucher's disease, histiocytosis, and any other
 CC hyperproliferative disease. The polypeptides and polynucleotides and
 CC methods are useful for diagnosing and treating the cited diseases. This
 CC sequence represents a reverse transcriptase PCR primer used in an
 CC analysis of human chemerin receptor (chemerin) expression by quantitative
 CC RT-PCR.

 PT Quantitating messenger RNA in sample - using immobilised-polynucleotide
 PT having sequence complementary to sequence unique to the mRNA.
 XX
 XX Claim 12 and 40; Page 56; 177bp; English.
 XX
 XX This sequence is a probe which was used in the quantification of human
 CC substance P receptor mRNA from substance P receptor cDNA-transferred
 CC cells. This probe was used in the method of the invention, for the
 CC detection and quantification of mRNA in a sample without the need to
 CC purify the mRNA from cells. The claimed method comprises identifying a
 CC polynucleotide sequence unique to the mRNA, and immobilising an oligomer
 CC complementary to this sequence to an insoluble support. The sample is
 CC then incubated with the bound oligomer and be immobilised. Non-immobilised
 CC will hybridise to the bound oligomer and be immobilised. Non-immobilised
 CC components are washed from the support and bound RNA is labeled in such
 CC a way that the label is incorporated onto the support relative to the
 CC amount of mRNA on the support. The amount of bound label is then
 CC determined. This method can be used for the reliable, rapid, simultaneous
 CC quantification and recognition of patho- physiology of various diseases.
 CC diagnosing and recognition of patho- physiology of various diseases.
 CC states, eg. hereditary diseases, cancer, and infectious diseases.
 CC Substance P is a neurotransmitter. Because the nerves expressing
 CC substance P are involved in pain receptor pathways, the ability to
 CC measure the mRNA of substance P would be useful in the development of
 CC analgesics. See also AAQ47381-666. (Updated on 25-MAR-2003 to correct PN
 CC field.)

 XX
 CC The invention relates to an isolated nucleic acid from a human gene
 CC encoding aminopeptidase P (XPNBP2), bradykinin receptor B1 (BDKRB1),
 CC tachykinin receptor B1 (TACR1), CI esterase inhibitor (C1NH), kallikrein
 CC 1 (KKL1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme
 CC 2 (ACE2), or protease inhibitor 4 (P14), comprising at least one
 CC polymorphic position. Also included are (1) a probe that hybridises to a
 CC polymorphic position as provided in the detailed summary of single
 CC nucleotide polymorphisms comprising additional 5' and 3' flanking genomic
 CC sequence; (2) analysing (M1) at least one nucleic acid sample comprising

CC obtaining the sample from one or more individuals and determining the
 CC nucleic acid sequence at one or more polymorphic positions in a gene
 CC encoding a protein selected from the group above; (3) constructing (M2)
 CC haplotypes using the genes comprising grouping at least two nucleic acids
 CC ; (4) identifying (M3) an individual at risk of developing a disorder
 CC upon administration of an ACE inhibitor and/or vasopressin inhibitor
 CC using the polymorphic data; (5) a library of nucleic acids, each of which
 CC comprises one or more polymorphic positions within a gene encoding a
 CC human protein selected from the group above; and (6) genotyping (M4) an
 CC individual comprising obtaining a nucleic acid sample, determining the
 CC nucleotide present in at least one polymorphic position, and comparing at
 CC least one position with a known data set. The genes, (M1, M2, M3 and M4)
 CC and compositions are useful for detecting, diagnosing, treating,
 CC preventing various disorders such as angiodaema and diseases which
 CC involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's
 CC disease, trachomas, and cardiovascular diseases like angina pectoris,
 CC hypertension, heart failure, myocardial infarction, ventricular
 CC hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary
 CC artery disease, arteriosclerosis and/or atherosclerosis, and
 CC hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory
 CC arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic
 CC obstructive pulmonary disease (COPD) and enterocolitis (many other
 CC diseases and disorders are listed in the specification). The
 CC polymorphisms are also useful for chromosome identification. Antibodies
 CC against the proteins may be utilised for immunophenotyping of cell lines
 CC and biological samples. The present sequence represents or contains the
 CC region surrounding a single-nucleotide polymorphism in one of the genes
 CC encoding one of the proteins listed above

 DR
 XX Identifying genetic profile associated with a neurological, psychiatric,
 PT or psychological condition, comprises screening individuals for a
 PT polymorphism in a genetic locus comprising the dopamine receptor D2
 PT (DRD2) gene.
 XX
 XX Claim 31; SEQ ID NO 1318; 634pp; English.
 PS
 XX The invention relates to a method of identifying a genetic profile
 CC associated with a neurological, psychiatric or psychological condition,
 CC phenotypic or state including a sub-threshold neurological, psychiatric or
 CC psychological condition, phenotype or state in an individual, comprising
 CC screening individuals for a polymorphism in a genetic locus comprising
 CC the dopamine receptor D2 (DRD2) gene. The invention also relates to a
 CC genetic mutation providing a genetic marker for a neurological,
 CC psychiatric, or psychological condition, state or phenotype in an
 CC individual, where the presence of a 957C polymorphism is indicative of a
 CC predisposition to developing a neurological, psychiatric or psychological
 CC condition, phenotype or state. The compositions and methods are useful
 CC for identifying a genetic profile associated with a neurological,
 CC psychiatric or psychological condition. The method enables clinicians to
 CC make a genetic-based diagnosis of a neurological, psychiatric or
 CC psychological condition and can thereby implement treatment or
 CC preventative or symptom-ameliorating protocols to reduce the adverse
 CC consequences of the condition. This sequence represents a human dopamine
 CC receptor D2 (DRD2) DNA oligonucleotide used in the scope of the
 CC invention.

XX WPI, 1999-045139/04.
XX
XX Nucleic acids and chimeric genes for increasing seed lysine content -
XX comprise sequence encoding all or part of lysine ketoglutarate reductase,
XX useful to improve nutritional quality of seeds from transformed plants.
XX
XX Example 21; Page 104; 231pp; English.
XX
XX This synthetic double-stranded oligonucleotide encodes a lysine-rich
XX heptad repeat peptide. It can be inserted into the unique *Eari* site in
XX the 'base gene' (see AAV99505) of vector PSK5 to provide repetitive
XX heptad coding sequences. Chimeric genes for lysine-rich synthetic seed
XX storage proteins suitable for expression in the seeds of plants have been
XX constructed (see AAV99513-18, AAV99527-32, AAV99539-41). The invention
XX provides methods for improving the nutritional quality of seeds from
XX transgenic plants by increasing lysine content

XX
XX Transformed plants that accumulate lysine at higher levels in its seeds
XX than untransformed plants, has gene fragments encoding lysine-insensitive
XX dihydrodipicolinic acid synthase and lysine ketoglutarate reductase.
XX
XX Example 21; Col 79; 109pp; English.
XX

XX The invention relates to a plant comprising two foreign nucleotide
XX sequences which cause seeds obtained from the plant to accumulate lysine
XX at a level of at least 10% higher than seeds of a plant that do not
XX comprise the nucleotide, where the nucleotide comprises a fragment
XX encoding a dihydrodipicolinic acid synthase (DHPS) that is insensitive
XX to lysine inhibition, and a fragment encoding a plant lysine
XX ketoglutarate reductase (LKR) or its subfragment. The nucleotide fragment
XX is operably linked to a plant chloroplast transit sequence (CTS) and the
XX plant lysine ketoglutarate reductase subfragment is used in antisense
XX inhibition or cosuppression. Also included are progeny plants from the
XX above mentioned plant and seeds obtained from the above mentioned plant.
XX The seeds obtained from the above mentioned plant (e.g., rapeseed,
XX soybean or corn) comprising the foreign nucleic acid sequences accumulate
XX lysine at a higher level, preferably at a level of at least 10% higher
XX than seeds of a plant that do not comprise the foreign nucleic acid
XX sequences. Chimeric gene comprising DHPS from *C. glutamicum* and
XX aspartokinase III (from the *lysC* gene) of *E. coli* (mutated to be lysine-
XX insensitive) are also used to generate the above transgenic plants. Also
XX disclosed are synthetic seed storage proteins (SSP) used as an internal
XX source of lysine, built up from synthetic peptide monomers based around
XX an *Eari* site sequence (for generating multimeric proteins). The present
XX sequence is a strand of an oligonucleotide encoding an SSP monomer.

XX dihydrodipicolinic acid synthase and lysine ketoglutarate reductase.
XX
XX Example 21; Col 79; 109pp; English.
XX

XX The invention relates to a plant comprising two foreign nucleotide
CC sequences which cause seeds obtained from the plant to accumulate lysine
CC at a level of at least 10% higher than seeds of a plant that do not
CC comprise the nucleotide, where the nucleotide comprises a fragment
CC encoding a dihydrodipicolinic acid synthase (DHDS) that is insensitive
CC to lysine inhibition, and a fragment encoding a plant lysine
CC ketoglutarate reductase (LKR) or its subfragment. The nucleotide fragment
CC is operably linked to a plant chloroplast transit sequence (CTS) and the
CC plant lysine ketoglutarate reductase subfragment is used in antisense
CC inhibition or cosuppression. Also included are progeny plants from the
CC above mentioned plant and seeds obtained from the above mentioned plant.
CC The seeds obtained from the above mentioned plant (e.g., rapeseed,
CC soybean or corn) comprising the foreign nucleic acid sequences accumulate
CC lysine at a higher level, preferably at a level of at least 10% higher
CC than seeds of a plant that do not comprise the foreign nucleic acid
CC sequences. Chimeric gene comprising DHDS from *C. glutamicum* and
CC aspartokinase III (from the *lysC* gene) of *E. coli* (mutated to be lysine-
CC insensitive) are also used to generate the above transgenic plants. Also
CC disclosed are synthetic seed storage proteins (SSP) used as an internal
CC source of lysine, built up from synthetic peptide monomers based around
CC an Earl site sequence (for generating multimeric proteins). The present
CC sequence is a strand of an oligonucleotide encoding an SSP monomer.

XX New nucleic acid fragment encoding aspartokinase and dihydrodipicolinic

XX PT

PT acid synthase, useful for increasing threonine or lysine content of seeds
PT of plant.
XX
XX Example 21; Page 43; 116pp; English.
XX
CC The invention relates to an isolated nucleic acid fragment comprising a
CC first nucleic acid subfragment encoding aspartokinase (AK) that is
CC substantially insensitive to inhibition by lysine, and a second nucleic
CC acid subfragment encoding dihydrodipicolinic acid synthase (DHDS) that
CC is substantially insensitive to inhibition by lysine. Also included are
CC an isolated nucleic acid fragment comprising a nucleic acid subfragment
CC encoding lysine ketoglutarate reductase (LKR), a chimeric gene (where
CC the nucleic acid fragment is operably linked to a plant chloroplast
CC transit sequence and to a seed-specific regulatory sequence, a plant
CC comprising the nucleic acid/chimeric gene in its genome, a seed obtained
CC from the plant, increasing threonine or lysine content of the seeds of
CC plant, a plant capable of transmitting the chimeric gene to a progeny of
CC plant having the ability to produce levels of free threonine or lysine at
CC least two times greater than the free threonine levels of untransformed
CC plants, a transformed (soybean) plant comprising seeds that accumulate
CC lysine at a level at least ten percent to four-fold higher than the seeds
CC of an untransformed plant, a transformed rapeseed comprising seeds that
CC accumulate lysine to a level between ten percent and one hundred percent
CC higher than that of the seeds of an untransformed plant, a monocot plant
CC comprising in its genome the nucleic acid fragment having the monocot-
CC embryo specific promoter and a transformed corn plant comprising seeds
CC that accumulate lysine to a level between ten percent and one hundred
CC thirty percent higher than the seeds of the untransformed plant. Also
CC disclosed are synthetic lysine-rich seed storage proteins (SSP), built up
CC from monomer lysine-rich heptad repeats (encoded by Bari restriction
CC enzyme-based oligonucleotides) used as a pool of lysine in a transformed
CC plant. The nucleic acid fragments, genes and methods are useful for
CC increasing threonine or lysine content of the seeds of the plant. Seeds
CC containing increased threonine or lysine content eliminate the need to
CC supplement mixed grain feeds with lysine or threonine produced via
CC microbial fermentation. The present sequence is one strand of a DNA
CC encoding a lysine-rich heptad repeat for use as a monomer unit in a
CC synthetic seed storage protein

XX

PS Claim 3; Page 81; 160pp; English.

XX This invention relates to a novel antisense compounds that modulate the
 CC expression of oestrogen receptor beta (ERSB). Oestrogen is a steroid
 CC hormone that exerts a wide range of effects throughout the human body
 CC being primarily involved in female sexual maturation. Additionally,
 CC however, oestrogen targets male reproductive tissues, is known to be
 CC important in bone maintenance and plays a protective role in the
 CC cardiovascular system. This hormone receptor, ERB (also known as ER
 CC beta, oestrogen receptor 2 and ERS2) has been mapped to chromosome 14q22-
 CC q24, a region known to be associated with early onset of Alzheimer's
 CC disease, uterine leiomyomata and neoplasms of the kidney. Furthermore,
 CC ERB has been localised to metastatic cells indicating an involvement in
 CC cellular proliferation. Accordingly, the selective inhibition of ERB by
 CC the cytoskeletal antisense oligonucleotides of this invention could provide
 CC a therapeutic target for the treatment of cancer, as well as other ERB-
 CC related disorders. This oligonucleotide sequence is the chimeric human
 CC antisense oligo used to inhibit expression of human ERB, the aim of the
 CC invention. Note that it has two terminal five nucleotide 2'-methoxyethyl
 CC (2'-MOE) wings separated by a ten deoxynucleotide gap. The
 CC oligonucleotide backbone is phosphorothioate throughout

XX New isolated or recombinant polynucleotide encoding a selenophosphate
 PT synthetase protein, useful for diagnosing and treating abnormal
 PT physiology or development, selenium poisoning and autoimmune disorders.
 XX
 XX Example; Col 32; 30pp; English.

XX The invention relates to an isolated or recombinant polynucleotide
 CC encoding a mature polypeptide with selenophosphate synthetase activity.
 CC The methods and compositions of the present invention are disclosed as
 CC being useful for diagnosing and treating conditions associated with the

CC selenophosphate synthetase (SPS) protein, such as abnormal physiology or
 CC development, selenium poisoning, abnormal iron or oxygen tolerance and
 CC autoimmune disorders. They can also be used as probes for detecting an
 CC levels of protein message in samples from patients suspected of having an
 CC abnormal conditions, such as cancer or developmental problem, and as
 CC diagnostic kits which test for the qualitative or quantitative presence
 CC of other markers. The enzymes may be used to screen for chemical
 CC modulators of SPS. Antibodies to SPS may be useful as SPS antagonists.
 CC The present sequence represents the human selenophosphate synthetase
 CC sense PCR primer.

XX Identifying genetic profile associated with a neurological, psychiatric,
 PT or psychological condition, comprises screening individuals for a
 PT polymorphism in a genetic locus comprising the dopamine receptor D2
 PT (DRD2) gene.

PS Claim 31; SEQ ID NO 1316; 634pp; English.

XX The invention relates to a method of identifying a genetic profile
 CC associated with a neurological, psychiatric or psychological condition,
 CC phenotype or state including a sub-threshold neurological, psychiatric or
 CC psychological condition, phenotype or state in an individual, comprising
 CC screening individuals for a polymorphism in a genetic locus comprising
 CC the dopamine receptor D2 (DRD2) gene. The invention also relates to a
 CC genetic mutation providing a genetic marker for a neurological,
 CC psychiatric, or psychological condition, state or phenotype in an
 CC individual, where the presence of a 957C polymorphism is indicative of a
 CC predisposition to developing a neurological, psychiatric or psychological
 CC condition, phenotype or state. The compositions and methods are useful
 CC for identifying a genetic profile associated with a neurological,
 CC psychiatric or psychological condition. The method enables clinicians to
 CC make a genetic-based diagnosis of a neurological, psychiatric or
 CC psychological condition and can thereby implement treatment or

CC preventative or symptom-ameliorating protocols to reduce the adverse
CC consequences of the condition. This sequence represents a human dopamine
CC receptor D2 (DRD2) DNA oligonucleotide used in the scope of the
CC invention.

 PT Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
 PT constructs, which down regulate expression of a CD20 gene or neurite
 PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
 PT central nervous system injury.
 XX
 PS Claim 30; Page 154; 2000P; English.
 XX
 CC The invention relates to a nucleic acid molecule which down regulates
 CC expression of a CD20 gene and a nucleic acid molecule which down
 CC regulates expression of a neurite growth inhibitor gene (NOGO). The
 CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
 CC DNAzyme) an inozyme (an endolytic nucleic acid cleaving a an RNA molecule
 CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or
 CC an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
 CC with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA
 CC of CD20 in the presence of a divalent cation that is preferably Mg²⁺.
 CC Furthermore, it may be contacted with a condition associated with the level
 CC of the cell and treat a patient having a condition associated with the level
 CC of CD20. The treatment may further comprise the use of one or more
 CC therapies. In particular, the CD20 targeting nucleic acid may be used to
 CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
 CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
 CC leukemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
 CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
 CC immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-
 CC targeting nucleic acid is used to cleave RNA of the NOGO gene in the
 CC presence of a divalent cation that is preferably Mg²⁺. Furthermore, the
 CC nucleic acid may be contacted with a cell to reduce NOGO activity of the

cell and treat a patient having a condition associated with the level of
 CC NOGO. The treatment may further comprise the use of one or more
 CC therapies. In particular, the NOGO-targeting nucleic acid may be used to
 CC treat central nervous system (CNS) injury and cerebrovascular accident
 CC (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
 CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
 CC Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
 CC disease, muscular dystrophy, and/or other neurodegenerative disease
 CC states which respond to the modulation of NOGO expression. The present
 CC sequence is a zinzyme molecule of the invention

 PT Receptors and signaling proteins of Meiotic Acting Sterols and nucleic
 PT acids, useful in modulating in gamete maturation process induced by beta
 PT -hydroxy-4,4-dimethylcholesterol-8,14,24-triene.
 XX
 PS Example 1; Page 19; 60P; English.
 XX
 CC The present sequence is that of a phosphorothioate sense oligonucleotide
 CC that corresponds to the Kozak sequence of SAM1b mRNA. It was
 CC microinjected into mouse oocytes where, unlike the corresponding
 CC antisense sequence (see ABL53527), it did not selective inhibition of
 CC SAM1b mRNA. SAM1b is a receptor of meiosis activating sterols (MAS) and
 CC is involved in the gamete maturation process induced by beta-hydroxy-4,4
 CC -dimethylcholesterol-8,14,24-triene (PP-MAS), specifically inducing, upon
 CC ligand activation, germinal vesicle breakdown in oocytes. The invention
 CC provides SAM1a polynucleotides (including RNA antisense sequences),

PT	New polynucleotide encoding a transducer of meiotic acting sterol-
PT	signaling or its regulatory domain, useful for isolating tissue specific
PT	variants of the transducer which may be used as anti-fertility or
PT	contraception drugs.
XX	
XX	Example 1; Page 18; 55pp; English.
XX	
XX	The present sequence is that of a sense oligonucleotide that corresponds
CC	to the Kozak sequence of mouse SAM1b mRNA (see ACF79541). It was used as
CC	a control in experiments with the corresponding antisense oligonucleotide
CC	(see ACF79551). Selective inhibition of the mRNA showed that SAM1b is
CC	crucially involved in meiotic acting sterol (MAS) signalling, since a
CC	functional knockout of de novo protein synthesis partly disrupted MAS
CC	signals in oocytes. SAM1b is a transducer of MAS signalling and is
CC	involved in the gamete maturation process induced by 3beta-hydroxy-4,4-
CC	diethyl cholesterol-8,14,24-triene (FF-MAS), specifically inducing germinal
CC	vesicle breakdown in mouse oocyte cultures in vitro. SAM1b can be used to
CC	screen for agonists or antagonists of FF-MAS activity for use as
CC	antifertility or contraceptive drugs

XX
XX Novel transducer of meiosis activating sterols designated SAM1a and SAM1b
XX useful for screening for agonist or antagonist of meiosis activating
XX PT sterols used to treat infertility or to provide a way of contraception.
XX
XX Example 2; SEQ ID NO 12; 31pp; English.
XX
XX The invention relates to a novel isolated transducer of meiosis
XX activating sterols (MAS)-signalling, its peptide fragment or a salt. The
XX isolated MAS-signalling transducer has antifertility activity. The MAS-
XX signalling transducer is useful for detecting the presence of a compound
XX or its salt which has affinity for the MAS-signalling transducer. The MAS
XX -signalling transducer is useful for detecting the presence of an
XX antagonist or agonist of the MAS-signalling transducer. The MAS-
XX signalling transducer is useful for detecting the presence of an
XX antagonist or agonist of the MAS-signalling transducer. The MAS-
XX signalling transducer is useful for detecting the presence of an agonist
XX or antagonist of the MAS-signalling transducer. The MAS-signalling
XX transducer is useful for screening for agonist or antagonist activity of
XX 4,4-dimethyl-5-alpha-cholesta-8,14,24-triene-3-beta-ol (FP-MAS) or MAS. An
XX expression vector containing the nucleic acid which encodes the MAS-
XX signalling transducer is useful for isolation of tissue and/or organ
XX specific variants of the MAS-signalling transducer. The agonist or
XX antagonist of the MAS-signalling transducer identified using the
XX transducer provides a way to control meiosis in order to treat
XX infertility or to achieve a novel principle of contraception. This
XX polynucleotide sequence represents a primer used in the exemplification
XX of the invention.

XX
XX New oligonucleotide primers amplifying gene regions conserved among
XX PT mammals - useful for developing genomic maps, isolating clones and making
XX cross-species comparisons.
XX
XX Claim 1; Page 10; 26pp; English.
XX
XX The present sequence represents a specifically claimed oligonucleotide
XX PCR primer. The oligonucleotide can be used for polymerase chain reaction
XX (PCR) amplification of DNA, specifically regions of specific genes that
XX are conserved among mammalian species, i.e. pairs of oligonucleotides
XX from the present specification represent universal mammalian sequence-
XX tagged site (UM-STS) primers. The primers are used to develop genomic
XX maps, to isolate clones from libraries, to make cross-species comparisons
XX and to develop additional genetic markers. UM-STS allow genomic
XX comparisons to be made between more species

 PS
 XX The present invention relates to the polypeptide haemofiltrate (HP) -
 CC chondro-osteomodulin (COM) and its natural or pharmacologically tolerable
 CC derivatives, especially amidated, acetylated, phosphorylated or
 CC glycosylated derivatives, or with N-terminal pyroglutamate. COM and its
 CC derivatives are useful for treatment of parathyroid disease (especially
 CC hypoparathyroidism), degenerative bone disease (especially osteoporosis),
 CC bone fractures, cartilage and connective tissue diseases, rheumatism and
 CC arthritis, fatty degeneration and diabetes type II, immune system
 CC disorders, disorders that can be treated by modifying migration of stem
 CC cells, kidney diseases associated with disrupted electrolyte excretion
 CC (especially renal insufficiency), also phosphate/calcium excretion, and
 CC skin diseases, e.g. psoriasis, eczema and acne, also viral, bacterial and
 CC parasitic infections, female infertility, ovarian and uterine tumours,
 CC autoimmune diseases and immune defects. They are also useful for
 CC diagnosis. The present sequence is a PCR primer used to isolate the
 CC protein of the invention.

XX
XX Novel chemically synthesized double stranded short interfering nucleic
PT acid molecule that directs cleavage of STAT3 RNA through RNA
PT interference, useful for treating cancer and inflammatory diseases e.g.
PT psoriasis in subject or organism.
XX
PS Example 3; SEQ ID NO 512; 266pp; English.
XX
XX The invention relates to a novel chemically synthesized double stranded
CC short interfering nucleic acid molecule that directs cleavage of a signal
CC transducer and activator of transcription 3 (STAT3) RNA by RNA
CC interference. The invention further includes a composition comprising the
CC short interfering nucleic acid in a carrier or diluent. The short
CC interfering nucleic acid has cytosolic, antiposrotatic, dermatological,
CC antiinflammatory, and gastrointestinal-Gen. activities. The short
CC interfering nucleic acid or its composition is useful for treating,
CC preventing, inhibiting, or reducing cancer, proliferative, and/or
CC inflammatory diseases, disorders, or conditions in a subject or organism,
CC such as psoriasis, eczema, dermatitis, Crohn's disease, and inflammatory
CC bowel disease, and for any other disease, trait, or condition that is
CC related to or will respond to the levels of STAT3 in a cell or tissue,
CC alone or in combination with other treatments or therapies. This oligo
CC sequence represents a STAT-3 siRNA strand of the invention.

XX
XX New RNAi agent targeted to a target transcript encoding a protein
PT involved in the development, pathogenesis, or symptoms of an IGE-mediated
PT disease or condition, useful for treating or preventing, e.g. allergic
PT rhinitis or asthma.
XX
XX Claim 10; SEQ ID NO 256; 133pp; English.
XX
XX The present invention relates to an RNAi agent targeted to a transcript
XX that encodes a protein involved in the development, pathogenesis, or
XX symptoms of an IGE-mediated disease or condition. Also claimed are a
XX composition comprising an RNAi agent; a method of treating or preventing
XX a disease characterized by inappropriate or excessive mast cell activity
XX or Th2 helper cell responses, or an IGE-mediated disease or condition
XX (e.g. hypersensitivity), or sepsis, shock or a burn-related injury; an
XX analog of the siRNA or shRNA; inhibiting expression of a target
XX transcript; and identifying an RNAi agent as comprising a sequence
XX suitable for treatment of a condition characterized by IGE-mediated
XX hypersensitivity or inappropriate or excessive mast cell activity or Th2
XX helper cell activity. The transcript encodes a protein selected from
XX FcεR1α, chain, FcεR1β, chain, c-Kit, Lyn, Syk, ICOS,
XX CD40, CD80, CD86, RelB, 4-1BB ligand, TLR1, TLR2, TLR3,
XX TLR4, TLR5, TLR6, TLR7, TLR8, TLR9, SLAMF, common gamma chain, and
XX COX-2. The RNAi agent is an RNAi vector, siRNA or shRNA. The composition
XX and methods are useful for diagnosing, preventing or treating IGE-
XX mediated diseases, such as allergic rhinitis, asthma, hypersensitivity,
XX sepsis, shock or a burn-related injury. These may also be used in
XX screening for agents that may treat or prevent such disease conditions.
XX The present sequence is a RNAi sense strand, targeting CD83.

XX New chemically modified double stranded short interfering nucleic acid
PT (siRNA) molecule that directs cleavage of a NOGO receptor (NOGOR) RNA via
PT RNA interference (RNAi), useful for modulating gene expression.
XX
XX Disclosure; SEQ ID NO 14; 171bp; English.
XX
XX The invention relates to chemically synthesized short interfering nucleic
CC acids (siRNAs) which downregulate expression of a NOGO receptor gene by
CC RNA interference. The siRNAs may or may not comprise ribonucleotides, can
CC contain deoxyribonucleotides, can be chemically modified and may be,
CC double or single stranded. They further comprise sense and antisense
CC regions, or alternatively are assembled from a sense oligonucleotide and
CC an antisense oligonucleotide. Specifically, the siRNAs include short
CC interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short
CC hairpin RNA (shRNA). The invention also relates to pharmaceutical
CC compositions comprising a siRNA targeted to a NOGO receptor mRNA. It
CC further discloses siRNAs targeted to a NOGO receptor gene, siRNAs targeted
CC to a NOGO gene itself, and expression vectors and host cells comprising
CC a siRNA of the invention. In particular, the invention discloses siRNAs
CC (AEF75903-AEF76100 and AEF76101-AEF76112) targeted to the human NOGO
CC receptor gene of GenBank accession number BC011787, and siRNAs (AEF75451-
CC AEF75902) targeted to the human NOGO-A (KIAA0886) gene of DDBJ accession
CC number AB020693. The siRNAs are used to modulate expression of NOGO
CC receptor or NOGO genes in cells, tissue explants or organisms (e.g., by
CC ex vivo gene therapy), or in grafts and transplants for the treatment of
CC a variety of neurodegenerative conditions such as central nervous system
CC (CNS) injury (e.g., spinal cord injury or stroke), multiple sclerosis
CC (MS), muscular dystrophy, chemotherapy-induced neuropathy, amyotrophic
CC lateral sclerosis (ALS), ataxia, Parkinson's disease, Huntington's
CC disease, dementia, Creutzfeldt-Jakob disease and especially Alzheimer's
CC disease. The siRNAs may also be used in drug screening, diagnosis,
CC therapeutic target identification and validation, genetic engineering,
CC pharmacogenomics, studying gene function, and gene mapping (e.g., of
CC single nucleotide polymorphisms). The present sequence represents the
CC sense strand of a human NOGO-A-targeted double-stranded siRNA, which is
CC identical to the NOGO-A transcript target sequence.

DR Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
XX stability - useful for treating e.g. tumour angiogenesis, psoriasis,
PT rheumatoid arthritis, etc., in a human patient.
PT Claim 4; Page 129; 218bp; English.
XX
PS The present invention describes nucleic acid molecules which modulate the
CC synthesis, expression and/or stability of a mRNA encoding 1 or more
CC receptors of vascular endothelial growth factor (VEGF). A patient
CC (preferably human) having a condition associated with the level of the
CC fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
CC receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
CC angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
CC treated by administering the nucleic acid molecule or the expression
CC vector to the patient. AAK7275 to AAK75752 represent specific examples
CC of nucleic acid molecules from the present invention

PT Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
PT constructs, which down regulate expression of a CD20 gene or neurite
PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
PT central nervous system injury.
XX
PS Claim 88; Page 98; 200Pp; English.
XX
CC The invention relates to a nucleic acid molecule which down regulates
CC expression of a CD20 gene and a nucleic acid molecule which down
CC regulates expression of a neurite growth inhibitor gene (NOGO). The
CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
CC DNazyme) an inozyme (an endolytic nucleic acid cleaving a an RNA molecule
CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or
CC an amberyne (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
CC with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA
CC of CD20 in the presence of a divalent cation that is preferably Mg²⁺.
CC Furthermore, it may be contacted with a cell to reduce CD20 activity of
CC the cell and treat a patient having a condition associated with the level
CC of CD20. The treatment may further comprise the use of one or more
CC therapies. In particular, the CD20 targeting nucleic acid may be used to
CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
CC leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
CC immune thrombocytopenia, and inflammatory arthropathy. The NOGO-
CC targeting nucleic acid is used to cleave RNA of the NOGO gene in the
CC presence of a divalent cation that is preferably Mg²⁺. Furthermore, the
CC nucleic acid may be contacted with a cell to reduce NOGO activity of the
CC cell and treat a patient having a condition associated with the level of
CC NOGO. The treatment may further comprise the use of one or more
CC therapies. In particular, the NOGO-targetting nucleic acid may be used to
CC treat central nervous system (CNS) injury and cerebrovascular accident
CC (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
CC Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
CC disease, muscular dystrophy, and/or other neurodegenerative disease
CC states which respond to the modulation of NOGO expression. The present
CC sequence is a zinzyme molecule of the invention

XX
CC The present invention relates to the use of enzymatic nucleic acid
CC molecules (e.g. ribozymes) to modulate gene expression. The invention
CC also methods for their use to down regulate or inhibit the expression of

CC genes encoding protein-tyrosine-phosphatase-1b (PTB-1B), methionine
CC aminopeptidase (MeLAP-2), human telomerase (hTERT), protein kinase C
CC alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor
CC receptor-2 (HER2/c-erb2/neu), phospholamban (PLN), presenilin-1 (ps-1),
CC presenilin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic
CC nucleic acid molecules used to inhibit the expression of the said genes
CC include hammerhead (HH), hairpin, NCH (inosyme), G-cleaver, amberzyme,
CC zincyme, and/or DNzyme motifs. The methods of the invention are useful
CC for treating cancer, in particular breast cancer, Alzheimer's disease,
CC diabetes, obesity, cardiac diseases e.g. heart disease, age-related
CC diseases, hepatitis B infections, and hepatitis and hepatocellular
CC carcinoma. The enzymatic nucleic acid molecules can also be used as
CC diagnostic tools to examine genetic drift and mutations within diseased
CC cells and to detect the presence of specific RNA in a cell. The present
CC sequence represents a substrate/target sequence for a ribozyme used in
CC the examples of the present invention. Note: Some SEQ ID Nos are repeated
CC more than once in the specification, but these have different sequences
CC associated with them.

CC This invention describes a novel human G-protein coupled receptor (GPCR),
CC HGRBM9 which is included in the American Type Culture Collection

CC Deposit No. PTA-2675. The protein of the invention has analgesic,
CC antiaddictive, antibacterial, anticonvulsant, antidepressant,
CC antiinflammatory, antianemic, antiparkinsonian, antiserotonergic,
CC cardiant, cyostatic, haemostatic, hypnotic, neuroleptic,
CC neuroprotective, nootropic, tranquiliser, vasotropic and vulnery (II),
CC activity. The nucleic acid molecule (I), the encoded polypeptide (II),
CC and the associated reagents and methods are useful for diagnosing,
CC preventing or treating conditions selected from neurodegenerative disease
CC states, behavioural disorders, inflammatory conditions, aberrant
CC behaviour, memory disorders, aberrant cognitive functioning, dorsal raphe
CC disorders, serotonin expression, serotonin uptake, anxiety, fear,
CC depression, sleep disorders, pain, locus coeruleus disorders, disorders
CC associated with a failure to maintain an attentive or alert state,
CC nucleus accumbens disorders, disorders associated with the expression
CC and/or release of neurotransmitters such as dopamine, opioid peptides,
CC serotonin, GABA, and glutamate, addiction, hypothalamus disorders,
CC disorders affecting ability of the brain to maintain homeostasis,
CC neuroendocrine functions, hippocampus disorders, long term potentiation
CC disorders, substantia nigra disorders, disorders affecting dopaminergic
CC function, Alzheimer's, cognitive disorders, Parkinson's Disease,
CC Huntington's Disease, Tourette's Syndrome, meningitis, encephalitis,
CC demyelinating diseases, peripheral neuropathies, neoplasia, trauma,
CC congenital malformations, spinal cord injuries, ischaemia and infarction,
CC aneurysms, haemorrhages, schizophrenia, mania, dementia, paranoia,
CC obsessive compulsive disorder, depression, panic disorder, learning
CC disabilities, AIDS, psychoses, autism and altered behaviours, including
CC disorders in feeding, sleep patterns, balance, perception, lung cancer,
CC proliferative lung disorder, disorders associated with aberrant E-
CC selectin expression or activity; disorders associated with aberrant NFkB
CC expression or activity; disorders associated with aberrant IKKb/Ikba
CC expression or activity; an inflammatory disorder; an inflammatory
CC disorder associated with aberrant NFkB regulation or regulation of the
CC NFkB pathway; and proliferative disorders associated with aberrant NFkB
CC regulation or regulation of the NFkB pathway. This sequence represents a
CC PCR primer used to amplify the human HGPRTMY9 gene for
CC immunohistochemistry hybridisation expression profiling.

PT Novel 18S ribosome RNA gene derived from common marmoset, or its partial
PT fragment, useful as internal standard for measuring difference in
PT expression level of gene of interest in two or more types of test
PT samples.

XX
XX
PS Disclosure; SEQ ID NO 10; 21bp; Japanese.

XX The invention relates to a novel 18S ribosome RNA gene (I) derived from a
CC common marmoset, or its partial fragment (AEF82499). Also claimed is a
CC composition for detecting DNA or RNA, comprising the 18S RNA gene. The
CC 18S RNA gene is useful as an internal standard or a reference of the
CC expression level of a gene in the test sample during the measurement of
CC the difference in the expression level of a gene of interest in two or
CC more types of test sample, based on the difference in the transcription
CC product amount of the gene, where the test sample is derived from a
CC common marmoset. The transcription product amount of the gene of interest
CC is measured using a DNA array or by quantitative reverse transcriptase-
CC PCR. The present sequence represents an RT-PCR primer (see also AEF82507)
CC directed at the 18S RNA gene.

PT factor receptor gene.
XX
XX Example 3; SEQ ID NO 1762; 207pp; English.
XX
XX The present invention describes a double-stranded short interfering
CC nucleic acid (siNA) that downregulates expression of the vascular
CC endothelial growth factor receptor (VEGFR) gene. Also described: (1) a
CC siNA that downregulates the VEGF gene; (2) kits for in vitro or in vivo
CC delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors
CC that express siNA; and (5) single-stranded siNA with similar properties.
CC The siNAs have antiangiogenic, cytostatic, antidiabetic,
CC ophthalmological, antiarthritic, antipsoriatic, nephrotropic and
CC gynaecological activities. The siNA are useful for modulating
CC (downregulating) the expression of VEGFR genes. The siNA are potentially
CC useful for treating a wide range of angiogenesis-associated conditions,
CC particularly cancers, diabetic retinopathy, macular degeneration,
CC neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma,
CC and polycystic kidney disease. The siNA may also be useful for diagnosis,
CC drug screening, target identification and validation, genetic
CC engineering, studying gene function, and also for gene mapping (e.g. of
CC single-nucleotide polymorphisms). The present sequence is used in the
CC exemplification of the present invention.

XX
XX Selecting siRNA by selecting an siRNA molecule of 19-25 nucleoside bases
XX by selecting a target gene and measuring the functionality of the
XX nucleotide sequences that are complementary to a stretch of nucleotides
XX of the target sequence.
XX
XX Example 12; SEQ ID NO 2195; 199pp; English.
XX
XX The invention relates to a novel method for selecting siRNA (short
XX interfering RNA) comprising selecting an siRNA molecule of 19-25
XX nucleoside bases by selecting a target gene and measuring the
XX functionality of sequences of 19-25 nucleotides in length that are
XX substantially complementary to a stretch of nucleotides of the target
XX sequence, where the functionality is dependent upon non-target specific
XX criteria. Also claimed are methods for gene-silencing, developing an
XX siRNA algorithm for selecting siRNA, selecting an siRNA with improved
XX functionality, selecting hyperfunctional siRNA, an siRNA molecule
XX effective at silencing Bcl-2, and a kit for gene silencing comprising the
XX siRNA. The siRNA molecule comprises a sequence substantially similar to a
XX sequence consisting of GGGAGAGAGUGAGAGACAU; GAAGACUCCUCUCAGUU;
XX GUACGACACCGGAGUA; AGAUAUGAUGAUGAGACAU; UGAAGACUCCUCUCAGUU;
XX CAUCCGCGCUGUGUA; UGCGGCCUCUGUCAGUU; GAGAUAGUAGUAGACAU;
XX GGAGAUAGUAGUAGACAU; and GAAGACUCCUCUCAGUU. The siRNA molecule
XX comprises a sense strand and an anti-sense strand. The siRNA molecule
XX comprises a hairpin. The siRNA molecule comprises between 18 and 30 base
XX pairs. The kit comprises at least two siRNA, comprising a first optimised
XX siRNA and a second optimised siRNA. The method is useful in selecting
XX siRNA for generating a gene silencing reagent. The present sequence is
XX used in the exemplification of the invention.

XX PT New hyperactive mutant of the mariner transposase, useful for targeted
XX insertion of DNA, particularly for gene therapy, has at least one
XX phosphorylatable amino residue replaced by non-phosphorylatable residue.
XX PS Disclosure; SEQ ID NO 3; 62pp; French.
XX CC The present invention relates to a hyperactive transposase mutant (A)
XX from a mariner mobile genetic element (BGM). It has at least one mutation
XX at a phosphorylatable residue (pr), in at least one phosphorylation site,
XX that renders the site non-phosphorylatable. The BGM is from *Drosophila*
XX *mauriliiana* and represents the transposon from the Mos-1 element
XX (ADR05764). Unlike the wild-type transposase, (A), when expressed in
XX eukaryotes, is not subjected to phosphorylation (post-translation
XX modification), a process that reduces affinity for DNA and limits
XX conformational activity, resulting in a low capacity for catalysis of
XX transposition. The non-phosphorylatable mutants are at least 25,
XX preferably 100, times more active. (A) is useful for in vitro
XX transposition of transposable DNA of interest into a target DNA,
XX particularly for use in gene therapy where the transposable DNA is
XX introduced into a host cell genome. The present sequence was used for
XX cloning a ribosome binding site for vector construction.

XX
XX Example 3; SEQ ID NO 149; 210pp; English.
XX
XX The invention describes a chemically synthesized double stranded short
CC interfering nucleic acid (siRNA) molecule (I) that directs cleavage of a G

CC protein-coupled receptor for asthma susceptibility (GPR) RNA through RNA
CC interference (RNAi), where each strand of (I) has 18-23 nucleotides and
CC one strand of (I) comprises nucleotide sequence having sufficient
CC complementarity to the GPR RNA to direct cleavage of the GPR RNA by RNA
CC interference. Also described is a composition comprising (I) and a siRNA
CC carrier or diluent; validating GPR; a kit comprising (I); and an siRNA
CC construct. (I) exhibits improved stability, bioavailability and
CC activation of cellular responses, thus mediating RNA interference. This
CC sequence represents the target polynucleotide of a G protein-coupled
CC receptor 154 (GPR154) specific siRNA used to control GPR gene
CC expression.

 DR Novel chemically synthesized double-stranded short interfering nucleic
 XX acid molecule directing cleavage of telomerase RNA by RNA interference,
 PT useful for treating cancer and restenosis.
 PT Claim 33; SEQ ID NO 216; 304pp; English.
 XX The invention relates to chemically synthesized short interfering nucleic
 CC acids (siRNAs) which downregulate expression of telomerase genes by RNA
 CC interference. The siRNAs may or may not comprise ribonucleotides, can
 CC contain deoxyribonucleotides, can be chemically modified and may be
 CC double or single stranded. They further comprise sense and antisense
 CC regions, or alternatively are assembled from a sense oligonucleotide and
 CC an antisense oligonucleotide. Specifically, the siRNAs include short
 CC interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short
 CC hairpin RNA (shRNA). The invention also relates to pharmaceutical
 CC compositions comprising an siRNA targeted to the human telomerase mRNA
 CC which may have a cytosolic, immunosuppressive, vasotropic or
 CC antimicrobial activity. The invention further discloses expression
 CC vectors and host cells comprising an siRNA of the invention. The siRNAs are
 CC used to modulate expression of the telomerase gene in cells, tissue
 CC explants or organisms (for example by ex vivo gene therapy), or in grafts
 CC and transplants for the treatment of a variety of conditions. They may be
 CC used in the treatment of cancer, restenosis, infectious, and age-related
 CC rejection, and/or autoimmune, proliferative, and age-related
 CC diseases, disorders or conditions. The siRNAs may also be used in drug
 CC screening, diagnosis, therapeutic target identification and validation,
 CC genetic engineering, pharmacogenomics, studying gene function, and gene
 CC mapping (for example of single nucleotide polymorphisms). The present
 CC sequence represents the sense strand of a human telomerase-targeted
 CC double-stranded siRNA, which is identical to the telomerase transcript
 CC target sequence.

XX Mcawigen J, Belgelman L;
XX WPI; 2005-496858/50.
XX Novel chemically synthesized double-stranded short interfering nucleic
PT acid molecule directing cleavage of telomerase RNA by RNA interference,
PT useful for treating cancer and restenosis.
XX Claim 33; SEQ ID NO 439; 304pp; English.
XX The invention relates to chemically synthesized short interfering nucleic
CC acids (siRNAs) which downregulate expression of telomerase genes by RNA
CC interference. The siRNAs may or may not comprise ribonucleotides, can
CC contain deoxyribonucleotides, can be chemically modified and may be
CC double or single stranded. They further comprise sense and antisense
CC regions, or alternatively are assembled from a sense oligonucleotide and
CC an antisense oligonucleotide. Specifically, the siRNAs include short
CC interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short
CC hairpin RNA (shRNA). The invention also relates to pharmaceutical
CC compositions comprising an siRNA targeted to the human telomerase mRNA
CC which may have a cytosolic, immunosuppressive, vasotropic or
CC antimicrobial activity. The invention further discloses expression

CC vectors and host cells comprising an siRNA of the invention. The siRNAs are
CC used to modulate expression of the telomerase gene in cells, tissue
CC explants or organisms (for example by ex vivo gene therapy), or in grafts
CC and transplants for the treatment of a variety of conditions. They may be
CC used in the treatment of cancer, restenosis, transplant and/or tissue
CC rejection, and/or autoimmune, proliferative, infectious, and age-related
CC diseases, disorders or conditions. The siRNAs may also be used in drug
CC screening, diagnosis, therapeutic target identification and validation,
CC genetic engineering, pharmacogenomics, studying gene function, and gene
CC mapping (for example of single nucleotide polymorphisms). The present
CC sequence represents the antisense strand of a human telomerase-targeted
CC double-stranded siRNA.

PS
XX
XX The invention relates to chemically synthesized short interfering nucleic
CC acids (siNAs) which downregulate expression of a NOGO receptor gene by
CC RNA interference. The siNAs may or may not comprise ribonucleotides, can
CC contain deoxyribonucleotides, can be chemically modified and may be
CC double or single stranded. They further comprise sense and antisense
CC regions, or alternatively are assembled from a sense oligonucleotide and
CC an antisense oligonucleotide. Specifically, the siNAs include short
CC interfering RNA (shRNA), double-stranded RNA, micro-RNA (miRNA) and short
CC hairpin RNA (shRNA). The invention also relates to pharmaceutical
CC compositions comprising an siNA targeted to a NOGO receptor mRNA. It
CC further discloses siNAs targeted to a NOGO receptor gene, siNAs targeted
CC to a NOGO gene itself, and expression vectors and host cells comprising
CC an siNA of the invention. In particular, the invention discloses siRNAs
CC (AEF75903-AEF76100 and AEF76101-AEF76112) targeted to the human NOGO
CC receptor gene of GenBank accession number BC011787, and siRNAs (AEF75451-
CC AEF75902) targeted to the human NOGO-A (KIAA0866) gene of DDBJ accession
CC number AB020693. The siNAs are used to modulate expression of NOGO
CC receptor or NOGO genes in cells, tissue explants or organisms (e.g., by
CC ex vivo gene therapy), or in grafts and transplants for the treatment of
CC a variety of neurodegenerative conditions such as central nervous system
CC (CNS) injury (e.g., spinal cord injury or stroke), multiple sclerosis
CC (MS), muscular dystrophy, chemotherapy-induced neuropathy, amyotrophic
CC lateral sclerosis (ALS), ataxia, Parkinson's disease, Huntingtons
CC disease, dementia, Creutzfeldt-Jakob disease and especially Alzheimers
CC disease. The siNAs may also be used in drug screening, diagnosis,
CC therapeutic target identification and validation, genetic engineering,
CC pharmacogenetics, studying gene function, and gene mapping (e.g., of
CC single nucleotide polymorphisms). The present sequence represents the
CC sense strand of a human NOGO-A-targeted double-stranded siRNA, which is
CC identical to the NOGO-A transcript target sequence.

New antisense oligonucleotides useful for treating e.g. pulmonary
vasoconstriction, inflammation, allergies, asthma, hypertension,
bronchitis, emphysema, respiratory distress syndrome, ischemia or
cancers.
Claim 18; Page 436; 1343pp; English.
The present invention describes a new composition comprising an antisense
oligonucleotide (ON) with low adenosine (up to 15%), which targets
nucleic acids involved in bronchoconstriction, allergies, and/or
inflammation. The ON can have antiinflammatory, antiallergic,
antiasthmatic, cyostatic and analgesic activities. The compositions are
useful for the treatment of diseases associated with inflammation,
impaired airways, including lung disease and diseases whose secondary
effects afflict the lungs of a subject. They can be used for treating
e.g. ischaemic conditions, respiratory distress syndrome, pain, cystic
fibrosis, pulmonary hypertension, emphysema, chronic obstructive
pulmonary disease (COPD), and cancers such as leukemias, lymphomas,
carcinomas, and cancers which may metastasise to the lungs, including
the breast and prostate cancer. The reduction of the adenosine content of the
ONs reduces side effects. The A-containing ONs break down with the
release of deoxyadenosine which activates adenosine receptors causing
bronchoconstriction and inflammation. AAA3313 to AAA3512 represent the
nucleotide sequences given in the sequence listing from the present
invention, which correspond to SEQ ID NO:1 to 185, and then the last 185
sequences are also called SEQ ID NO:1 to 185, but the sequences differ
from the previously named sequences. SEQ ID NO:11 to 1680 (AAA3233 to
AAA3992) are specifically claimed ONs from the present invention. N.B.
Sequences given in the disclosure of the present invention do not match
up with their corresponding SEQ ID NO: sequences given in the sequence
listing

 PT Low adenosine (A) content antisense oligonucleotides which do not trigger
 PT adenosine receptors during metabolism, useful e.g. for treating cancers
 PT and respiratory obstructions.
 PS
 XX Claim 14; Page 245; 1592pp; English.

The present invention describes low adenosine (A) content antisense
 CC oligonucleotides and compositions (I) comprising them. In the antisense
 CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
 CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
 CC immunosuppressive, antiaesthetic, hypotensive and cytoskeletal activities.
 CC The antisense oligonucleotides and (I) can be used to down-regulate the
 CC expression and/or activity of target polypeptides associated with
 CC lung/respiratory disorders and malignancies, such as stimulating and
 CC activating peptide factors and transmitters, transcription factors,
 CC immunoglobulins and antibodies, antibody receptors, cytokines and
 CC chemokines, endogenously produced specific and non-specific enzymes,
 CC binding proteins, adhesion molecules and their receptors, cytokine and
 CC chemokine receptors, adenosine receptors, bradykinin receptors, central
 CC nervous system (CNS) and peripheral nervous and non-nervous system
 CC receptors, CNS and peripheral nervous and non-nervous system peptide
 CC transmitters, defense, growth factors, vasoactive peptides and
 CC receptors, binding proteins and malignancy associated proteins. The
 CC antisense oligonucleotides may be used in this way to treat disorders
 CC including respiratory obstruction (especially pulmonary obstruction

CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
 CC surfactant hypoproduction which are associated with a disease or
 CC condition selected from pulmonary vasoconstriction, inflammation,
 CC allergies, asthma, impeded respiration, respiratory distress syndrome
 CC (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
 CC hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
 CC pulmonary transplantation rejection, pulmonary infections, bronchitis,
 CC and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
 CC fragments and antisense oligonucleotides used in the exemplification of

XX
XX Pharmaceutical composition for treating asthma, has antisense
PT oligonucleotide containing less percentage of adenosine, targeted to
PT nucleic acids associated with lung airway or lung dysfunction, and

PT bronchodilating agent.

XX
XX Claim 15; SEQ ID NO 10742; 763pp; English.

PS
XX This invention describes a novel composition (a) a first active agent,
XX comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has antiallergic, antiinflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hyperextension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

 DR
 XX Pharmaceutical composition for treating asthma, has antisense
 PT oligonucleotide containing less percentage of adenosine, targeted to
 PT nucleic acids associated with lung airway or lung dysfunction, and
 PT bronchodilating agent.
 PS
 XX Claim 15; SEQ ID NO 10743; 763bp; English.
 XX This invention describes a novel composition (a) a first active agent,
 CC comprising oligonucleotides, effective for alleviating
 CC bronchoconstriction, respiratory tract inflammation, allergies and
 CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
 CC surfactant depletion or hyposecretion, when administered to a mammal. The
 CC oligonucleotides are derived from a gene encoding or regulating
 CC expression of a target polypeptide associated with lung airway or lung
 CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
 CC The invention also describes a kit, that comprises: (a) a delivery
 CC device, in separate containers, (b) the oligonucleotides, (c)
 CC instructions for adding a carrier and for use of the kit. The composition
 CC of the invention has anti-allergic, anti-inflammatory, antispasmodic,
 CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
 CC beta-adrenergic agonist. The composition is useful for preventing or
 CC treating a respiratory, lung or malignant disease. The administered
 CC composition comprises oligo and is administered to reduce the production
 CC or availability, or to increase the degradation of the target mRNA or to
 CC reduce the amount of target polypeptide present in the lungs. The
 CC pulmonary obstruction, and/or surfactant hypoproduction and/or lung
 CC inflammation, allergies and/or surfactant hypoproduction are associated
 CC with a disease or condition such as pulmonary vasoconstriction,
 CC inflammation, allergies, asthma, impeded respiration, respiratory
 CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
 CC hyperextension, emphysema, chronic obstructive pulmonary disease, pulmonary
 CC transplantation rejection, pulmonary infections, bronchitis or cancer.
 CC The reduced adenosine content of the anti-sense oligos corresponding to
 CC thymidines present in the target RNA serves to prevent the breakdown of
 CC the oligonucleotides into products that free adenosine into the system
 CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
 CC prevent any unwanted effects due to it

 DR
 XX Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
 PT constructs, which down regulate expression of a CD20 gene or neurite
 PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
 PT central nervous system injury.
 XX
 XX Claim 30; Page 152; 200pp; English.
 XX The invention relates to a nucleic acid molecule which down regulates
 CC expression of a CD20 gene and a nucleic acid molecule which down
 CC regulates expression of a neurite growth inhibitor gene (NOGO). The
 CC nucleic acid may be enzymatic nucleic acids (e.g. a ribozyme or a
 CC DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a NN motif) or
 CC an amberzyme (cleaving RNA with an NGN triplet), a zinyne (cleaving RNA
 CC with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA
 CC of CD20 in the presence of a divalent cation that is preferably Mg²⁺.
 CC Furthermore, it may be contacted with a cell to reduce CD20 activity of
 CC the cell and treat a patient having a condition associated with the level
 CC of CD20. The treatment may further comprise the use of one or more
 CC therapies. In particular, the CD20 targeting nucleic acid may be used to
 CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
 CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
 CC leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
 CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
 CC immune thrombocytopenia, and inflammatory arthropathy. The NOGO-
 CC targeting nucleic acid is used to cleave RNA of the NOGO gene in the
 CC presence of a divalent cation that is preferably Mg²⁺. Furthermore, the
 CC nucleic acid may be contacted with a cell to reduce NOGO activity of the
 CC cell and treat a patient having a condition comprising the use of one or more
 CC therapies. In particular, the NOGO-targeting nucleic acid may be used to
 CC treat central nervous system (CNS) injury and cerebrovascular accident
 CC (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
 CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
 CC Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
 CC disease, muscular dystrophy, and/or other neurodegenerative disease
 CC states which respond to the modulation of NOGO expression. The present
 CC sequence is a G-cleaver molecule of the invention

PS Disclosure; SEQ ID NO 6968; 214pp; English.
XX
CC The present invention describes a human genome-derived myosin-like
CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC nucleic acids can be used as probes to detect, characterise and quantify
CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC provide initial substrates for the recombinant engineering of hGDMLP-1
CC protein variants having desired phenotypic improvements, and for
CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC used as immunogens to raise antibodies that specifically recognise hGDMLP
CC -1 proteins, as standards in assays used to determine the concentration
CC and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC capture probes for surface-enhanced laser desorption/ionisation, as
CC therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC production, and in vaccines or for replacement therapy. The
CC polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC disorder associated with the expression of hGDMLP-1, in particular heart
CC and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC The present sequence represents an oligomer used in the screening of the
CC hGDMLP-1 sequence in the exemplification of the present invention. N.B.

XX
XX The invention relates to a novel polypeptide (I) comprising a sequence
XX (SI) of myosin-like protein-1 (hGDMLP-1) having 2568 amino acids fully
XX defined in the specification, a fragment of at least 8 amino acids of
XX (SI), 95% deviation from (SI) which are conservative substitutions, and
XX 65% identity to (SI). A polypeptide of the invention acts as a agonist or
XX antagonist of hGDMLP-1, or as an inhibitor of hGDMLP-1 activity. A
XX pharmaceutical composition of the invention is useful for treating or
XX preventing a disorder associated with decreased expression or activity of
XX hGDMLP-1, such as a disorder of heart and/or skeletal muscle function.
XX The present sequence represents a 17-mer nucleotide, used in the
XX invention for scanning the sequence represented in ACN63103

XX
XX Screening for compounds that selectively bind to a rat D4 dopamine
XX receptor (DDR), useful for identifying dopamine (ant)agonists, comprises
XX exposing cells transfected with a nucleic acid encoding the DDR to
XX candidate compounds.
XX
XX Disclosure; Col 6; 29pp; English.
XX
XX The present sequence is an oligonucleotide which was used to screen a
XX lambda Dash rat spleen genomic library for D2-like receptor sequences.
XX The primer is derived from consensus sequences in rat D2 and D3 genes.
XX This method was used to isolate the rat D4 dopamine receptor gene. A cDNA
XX encoding the rat D4 dopamine receptor was expressed in transfected
XX mammalian cells and shown to preferentially bind dopamine antagonists
XX such as clozapine. The cDNA is useful for screening drugs which
XX specifically bind to the receptor and have selective effects on the
XX cardiovascular and retinal tissues through interactions with the
XX receptor. Such compounds may act as vasoregulators or may have ionotropic
XX effects. The D4 receptor protein may be used for the production of
XX polyclonal or monoclonal antibodies which recognise the D4 receptor
XX sequence but do not recognise other dopaminergic receptors. The
XX antibodies may be used in immunocytochemical studies and for
XX identification and isolation via flow sorting of D4 expressing cell types

XX a probe for related D4 dopamine receptors.
XX
```

```
XX
XX Example 1; Col 6; 33pp; English.
XX
XX The invention relates to an isolated nucleic acid molecule encoding rat
XX D4 dopamine receptor. The rat D4 dopamine receptor binds dopamine
XX antagonists such as clozapine. The nucleic acid is useful as a probe for
XX related D4 dopamine receptors. The nucleic acid when expressed in cell
XX lines, is useful as an in vitro screen for drugs which specifically bind
XX to the receptor. Antibodies to the protein are useful in
XX immunocytochemical studies, identification and isolation via flow sorting
XX of D4 expressing cell types and in blocking or modifying the effects of
XX D4 agonists and/or antagonists. The present sequence represents the rat
XX dopamine D2 and D3 receptors transmembrane domain VI primer. ORD-403,

PS Claim 21; SEQ ID NO 6618; 123pp; English.

XX The invention comprises amino acid and coding sequences containing

CC genetic polymorphisms associated with an altered risk of developing an

CC autoimmune disease (e.g. rheumatoid arthritis). The invention further

CC comprises a method of identifying an individual that has an altered risk

CC of developing an autoimmune disease, comprising detecting a single

CC nucleotide polymorphism (SNP) in a nucleic acid of the invention. The DNA

CC and protein sequences of the invention are useful for diagnosing and

CC treating autoimmune diseases, such as: rheumatoid arthritis, type 1

CC diabetes, multiple sclerosis, systemic lupus erythematosus, inflammatory

CC bowel diseases, psoriasis, thyroiditis, celiac disease, pernicious

CC anaemia, asthma, vitiligo, glomerulonephritis, Grave's disease, The

CC present DNA sequence represents a human autoimmune disease-related PCR

CC primer of the invention. NOTE: The present sequence is not shown in the

CC specification, but has been retrieved from the WIPO website.

XX
XX
PS Example 12; Page 85-91; 173pp; English.
XX
XX The primers of AAQ36431-32 were used in the identification of cDNA clone
CC encoding the Swiss 3T3 GRP Receptor. EXT 3 (AAQ36431) was used as a gene-
CC specific primer for reverse transcription of Swiss 3T3 mRNA, and EXT 2
CC (AAQ36432) was used as a gene specific primer for Taq DNA polymerase
CC catalysed PCR. The DNA sequences encoding mouse R1BP; human R1BP; rat
CC R2BP; human R2BP and human R3BP are given in AAQ29158-62 respectively.
CC The receptor gene and encoded polypeptide are used for screening for
CC agonists and antagonists of the receptor ligands, for producing
CC diagnostic or therapeutic reagents, and for producing antibodies. Hosts
CC suffering from abnormal receptor function, e.g. proliferative cell
CC conditions such as cancer, may be treated. The mouse GRP receptor was
CC isolated from Swiss 3T3 fibroblasts and sequenced. The sequence was used
CC to design oligonucleotide probes to isolate DNA encoding mouse GRP
CC receptor from a Swiss 3T3 cDNA library. This DNA was then used as a probe
CC to isolate rat NMB receptor, human GRP receptor, human NMB receptor and
CC human R3BP (incompletely characterised homologous putative receptor) from
CC DNA libraries. (Updated on 25-MAR-2003 to correct PN field.)

PT - and complexes with soluble CD40, for inhibiting infectivity of human
PT immune deficiency virus and to screen for inhibitors.
XX
PS Example; Page 53; 92pp; English.
XX
CC This primer is used for the RT-PCR amplification of a chemokine receptor
CC CXCR4. The invention provides gp120 derivative having a conformational,
CC discontinuous chemokine receptor binding site defined by amino acids
CC residues present in the gp120 constant regions C2, C3 and C4, and the
CC variable region V3, and its conformation is similar to that of the
CC receptor binding site of wild-type gp120 complexed by CD4. Exposure of
CC the chemokine receptor binding site is increased by having at least part
CC of a variable or constant region of wild-type gp120 removed. A stabilised
CC complex of gp120 CD4 binding site with a soluble CD4 molecule is used to
CC inhibit infectivity of human immune deficiency virus (HIV). Labelled
CC gp120 derivatives are also used to screen for inhibitors of HIV
CC infectivity. The gp120 derivatives are used for diagnosing susceptibility
CC to HIV infection from increased levels of the chemokine receptors (at the
CC protein or nucleic acid levels). Transgenic animals expressing CD4 and
CC chemokine receptor are used as models for studying development of AIDS or
CC effect/safety of therapeutic agents

XX
XX CC AAV49657-V49660 are PCR primers used in the amplification of a gene which
XX encodes a human protein which contains a SRCR (scavenger receptor,
XX cysteine-rich) domain. The gene and encoded protein can be used to

CC diagnose or treat tumours, particularly of the nervous system (medullo-
CC blastoma or glioma) or breast. The DNA sequence and probes derived from
CC it, are used to identify genes that express SRCR-domain containing
CC proteins, to determine the form in which these proteins exist and to
CC assess the significance of individual forms on cellular properties. The
CC protein can be used to detect the presence of autoantibodies and
CC antibodies which regulate its expression

XX
XX PT Identifying compounds which modulate expression of nucleic acids, used to
XX provide compounds having defined physical, chemical or bioactive
XX properties, e.g. antisense activity.
XX
XX PS Example 8; Page 77; 264pp; English.
XX
XX CC A method has been developed of defining a set of compounds that modulate
XX the expression of a target nucleic acid (tNA) sequence via binding of the
XX compounds with the tNA sequence. The method comprises generating a
XX library of virtual compounds in silico according to defined criteria, and
XX evaluating in silico the binding of the virtual compounds with the tNA
XX according to defined criteria. Also described are: (1) a method of
XX defining a set of oligonucleotides (ONs) that modulate the expression of
XX a tNA sequence via binding of the ONs with the tNA sequence comprising
XX generating a library of virtual compounds in silico according to defined
XX criteria, and evaluating in silico the binding of the virtual ONs with
XX the tNA according to defined criteria; and (2) a method of defining a set
XX of compounds that modulate the expression of a tNA sequence via binding
XX of the compounds with the tNA. The methods can be used for the generation
XX and identification of synthetic compounds having defined physical,

CC chemical or bioactive properties. Information gathered from assays of
CC such compounds is used to identify nucleic acid sequences that are
CC tractable to a variety of nucleotide sequence-based technologies, e.g.
CC antisense drug discovery and target validation. AA240852 to AA41220, and
CC AA52701 to AA52706, represent sequences used in the exemplification of
CC the present invention

XX
XX Evaluating a cellular response to an environmental compound, for use in
XX toxicological analysis, involves determining or comparing the expression
XX levels of at least one endogenous gene.
XX
XX Example 2; Page 25; 77pp; English.

XX
XX The sequence represents a PCR primer from alpha1-antichymotrypsin used in
XX a DDRT-PCR experiment, demonstrating the method of the invention. The
XX method relates to evaluating a cellular response to an environmental
XX compound, comprising determining or comparing the expression levels of at
XX least one endogenous gene e.g by differential display of reverse
XX transcribed mRNAs by PCR (DDRT-PCR). The method can be adapted to
XX identify compounds that act on the level of endogenous gene expression
XX through activating nuclear receptors. The method is useful in
XX toxicological analysis, diagnostics, for diagnosing cancer (e.g.
XX testicular, breast, prostate and endometrium), asthma, hypoplasia,
XX cryptorchism and/or allergy, and for evaluating the efficiency of a
XX treatment for hormonal deficiency or hormonal replacement therapy, in a
XX human such as a post-menopausal female. The method is also useful for
XX identifying environmental chemicals or pharmaceutical compositions that
XX interact with endocrine systems, and for detecting chemicals that pose a
XX health threat. Expression levels of endogenous genes are determined
XX rapidly using a sensitive technique, and the expression of any gene can
XX be monitored. The assays are far more informative than the currently used
XX assay, and significantly reduces the number of animals required for the
XX testing, as it is expected that essentially all the animals in a test
XX group will respond to the compound

PT Transgenic mice overexpressing the neurotrophin-3 receptor, useful e.g.
PT for studying and monitoring anxiety, depression and related disorders.

XX Example; Page 15; 38pp; Spanish.

XX The invention relates to transgenic mice which express the human
CC neurotrophin-3 receptor (NTRK3). The transgenic mice designated TgNTRK3
CC overexpress the wild-type NTRK3 (TRKC) gene, while those designated
CC TgNTRK3-K14 overexpress a form of NTRK3 which has a 14 amino acid
CC residue insert in the kinase domain. Both forms of the NTRK3 gene are
CC under the control of the PDGF (platelet-derived growth factor) promoter.
CC The NTRK3 gene is located in the region of human chromosome 15q24-25
CC which is duplicated in patients with anxiety disorders. Overexpression of
CC likely candidate for association with these disorders. Noradrenergic neurons,
CC NTRK3 has a trophic and proliferative effect on noradrenergic neurons,
CC increasing the response of the noradrenergic system. The transgenic mice
CC are used as models for studying the pathophysiology of anxiety disorders,
CC panic disorder, agoraphobia, social or simple phobias, major depression,
CC bipolar disorder, eating disorders (e.g., anorexia, bulimia, some cases
CC of obesity), and substance abuse (e.g., drug addiction). They may also be
CC used for identifying, monitoring and studying phenotypes of these
CC disorders, particularly during treatment; and for monitoring behavioural,
CC pharmaceutical or gene therapy-based treatments for these conditions.
CC Sequences AAF76208-AAF76209 represent NTRK3 reverse transcription-PCR
CC primers used in the exemplifications of the invention to study NTRK3
CC expression in transgenic mice of the invention and in control mice

XX New antisense oligonucleotides inhibiting the synthesis of proteins
PT involved in the formation of metastases such as transforming growth
PT factor-beta 1 (TGF-beta 1), TGF-beta 2 and TGF-beta 3, useful for
PT treating cancer.
XX
XX Claim 4; Page 72; 106pp; English.
XX
XX The invention relates to an antisense oligonucleotide or its active
CC derivative selected from AEC46374-AEC46395, targeting human interleukin-
CC 10 (IL-10). Also included are a process of manufacturing the antisense
CC oligonucleotide (or its active derivative, by adding consecutive
CC nucleosides and linker stepwise or by cutting the oligonucleotide out of
CC longer oligonucleotide chain), a pharmaceutical composition comprising a
CC composition for treating cancer. The oligonucleotide is an antisense
CC oligonucleotide inhibiting the synthesis of proteins involved in the
CC formation of metastases. The oligonucleotide is an antisense
CC oligonucleotide inhibiting the production of transforming growth factor
CC (TGF)-beta 1, TGF-beta 2, TGF-beta 3, cell-cell adhesion molecules
CC (CAMs), integrins, selectins, metalloproteases (MMPs), their tissue
CC inhibitors (TIMPs) and/or interleukins 10. The oligonucleotides are
CC useful for the preparation of a pharmaceutical composition for inhibiting
CC the formation of metastases in cancer treatment. The oligonucleotides are
CC useful for treating cancer, e.g. bile duct carcinoma, bladder carcinoma,
CC brain tumor, breast cancer, bronchogenic carcinoma, carcinoma of the
CC kidney, cervical cancer, choriocarcinoma, cystadenocarcinoma, cervical
CC carcinoma, colon carcinoma, colorectal carcinoma, embryonal carcinoma,
CC endometrial cancer, epithelial carcinoma, esophageal cancer, gall bladder
CC cancer, gastric cancer, head and neck cancer, hepatocellular cancer,
CC liver carcinoma, lung carcinoma, medullary carcinoma, non-small cell
CC bronchogenic/lung carcinoma, ovarian cancer, pancreas carcinoma, papillary
CC papillary carcinoma, papillary adenocarcinoma, prostate cancer, small
CC intestine carcinoma, rectal cancer, renal cell carcinoma, sebaceous gland
CC carcinoma, skin cancer, soft tissue cancer, squamous cell carcinoma,
CC testicular carcinoma, uterine cancer, acoustic neuromas, neurofibromas,
CC trachomas, and pyogenic granulomas; pre-malignant tumors, blastoma,
CC Bx/mg's tumor, craniopharyngioma, ependyoma, medulloblastoma,
CC hemangioblastoma, medulloblastoma, melanoma, mesothelioma, neuroblastoma,
CC neuroblastoma, pinealoma, retinoblastoma, sarcoma, seminoma, teratoma,
CC Wilms tumor and/or myeloma, multiple. The present sequence is an
XX antisense oligonucleotide targeting human TGF-beta-3.

PT Identifying single nucleotide polymorphism (SNP) haplotype that
PT correlates with the HLA type, useful for diagnosing an immunological or
PT inflammatory condition, comprises providing SNPs in the major
PT histocompatibility complex region.

XX
XX
PS Example 1; SEQ ID NO 3801; 175bp; English.

CC The invention relates to a method of identifying the nucleotide for each
CC of a set of single nucleotide polymorphisms (SNPs) in the major
CC histocompatibility complex (MHC) region in a population of individuals,
CC comprising providing the HLA type for the individuals and identifying an
CC SNP haplotype in the population that correlates with the HLA type, where
CC the SNP haplotype comprises the SNPs in the MHC region. The invention
CC also relates to a method of predicting the HLA type of an individual, a
CC method of determining the presence or absence of an allelic variant of an
CC MHC gene in an individual, a method of identifying an SNP haplotype that
CC correlates with susceptibility to a disease or condition, and a method of
CC determining the susceptibility of an individual to a disease or
CC condition. The disease or condition is an immune disorder or inflammatory
CC condition selected from inflammatory bowel disease, ulcerative colitis,
CC Crohn's disease, rheumatoid arthritis, diabetes, diabetes mellitus,
CC myasthenia gravis, vitiligo, Graves disease, Hashimoto's disease, systemic
CC Addison's disease, gastritis, autoimmune hepatitis, rheumatism, systemic
CC lupus erythematosus, systemic sclerosis, polymyositis, dermatomyositis,
CC pernicious anemia, primary biliary cirrhosis, idiopathic thrombocytopenia
CC purpura, Sjogren's syndrome, multiple sclerosis, Reiter's syndrome and
CC psoriasis. This sequence represents a human allele-specific
CC oligonucleotide used in the scope of the invention.

PT Novel isolated polynucleotide which is a polymorphic variant of
PT tachykinin receptor 1 (TACR1) gene useful for expressing TACR1 protein
PT isoform used in screening drug candidates to treat pain, depression,
PT vomiting.

XX
XX
PS Claim 17; Page 14; 89pp; English.

CC The invention relates to an isolated polynucleotide sequence which
CC comprises a tachykinin receptor 1 (TACR1) isogene (SG) that is any one of
CC 16 SG as given in specification, where each SG comprises specific regions
CC of the TACR1 genomic DNA appearing as ABK12169, and is defined by
CC polymorphisms at positions (p) 3164, 3319, 3906, 4339, 4444, 92915,
CC 94601, 94821, 94892, 94960. Also included are fragments of the TACR1
CC isogenes and TACR1 cDNA, a transgenic non-human animal transformed with
CC the TACR1 isogene or coding region, haplotyping (or genotyping) the TACR1
CC of an individual by determining either the haplotype of one or both
CC copies of the TACR1 gene, predicting the haplotype pair for the TACR1
CC gene of an individual, identifying an association between a trait and a
CC haplotype pair, an isolated oligonucleotide for detecting the
CC polymorphisms, a computer system for storing and analysing polymorphism
CC data and a genome anthology for TACR1 gene. The TACR1 isogene is useful
CC for studying expression and function of TACR1 and expressing TACR1
CC protein for use in screening for candidate drugs to treat diseases
CC related to TACR1 activity. The polymorphism and haplotype data is useful
CC for validating whether TACR1 is a suitable target for drugs to treat
CC pain, depression, vomiting, acute inflammatory diarrhoea and opiate
CC addiction. Screening for such drugs and reducing bias in clinical trials
CC of such drugs. The genotyping method is useful for determining whether an
CC individual has one of the haplotype pairs. The haplotyping method is
CC useful for improving efficiency and outcome of several steps in discovery
CC and development of drugs for treating the diseases. The haplotyping
CC method is also useful for validating TACR1 as a candidate target for
CC treating a specific condition or disease predicted to be associated with
CC TACR1 activity. The method is also useful for screening compounds to
CC treat a specific condition or disease predicted to be associated with
CC TACR1 activity. The methods are useful for identifying an association
CC between susceptibility to a disease, straging of a disease, or response to
CC a drug. The gene for TACR1 is located on human chromosome 2. The present
CC sequence is an allele specific oligonucleotide (ASO) probe used to detect
CC polymorphisms in the TACR1 gene

PT isoform used in screening drug candidates to treat pain, depression,
PT vomiting.
XX
PS Claim 17; Page 14; 89pp; English.
XX
XX The invention relates to an isolated polynucleotide sequence which
CC comprises a tachykinin receptor 1 (TACR1) isogene (SG) that is any one of
CC 16 SG as given in specification, where each SG comprises specific regions
CC of the TACR1 genomic DNA appearing as ABK12169, and is defined by
CC polymorphisms at positions (P) 3164, 3319, 3906, 4339, 4444, 92915,
CC 94601, 94821, 94892, 94960. Also included are fragments of the TACR1
CC isogenes and TACR1 cDNA, a transgenic non-human animal transformed with
CC the TACR1 isogene or coding region, haplotyping (or genotyping) the TACR1
CC of an individual by determining either the haplotype of one or both
CC copies of the TACR1 gene, predicting an association between a trait and a
CC haplotype pair, an isolated oligonucleotide for detecting the
CC polymorphisms, a computer system for storing and analysing polymorphism
CC data and a genome anthology for TACR1 gene. The TACR1 isogene is useful
CC for studying expression and function of TACR1 and expressing TACR1
CC protein for use in screening for candidate drugs to treat diseases
CC related to TACR1 activity. The polymorphism and haplotype data is useful
CC for validating whether TACR1 is a suitable target for drugs to treat
CC pain, depression, vomiting, acute inflammatory diarrhoea and opiate
CC addiction, screening for such drugs and reducing bias in clinical trials
CC of such drugs. The genotyping method is useful for determining whether an
CC individual has one of the haplotype pairs. The haplotyping method is
CC useful for improving efficiency and outcome of several steps in discovery
CC and development of drugs for treating the diseases. The haplotyping
CC method is also useful for validating TACR1 as a candidate target for
CC treating a specific condition or disease predicted to be associated with
CC TACR1 activity. The method is also useful for screening compounds to
CC treat a specific condition or disease predicted to be associated with
CC TACR1 activity. The method are useful for identifying an association
CC between susceptibility to a disease, staging of a disease, or response to
CC a drug. The gene for TACR1 is located on human chromosome 2. The present
CC sequence is an allele specific oligonucleotide (ASO) PCR primer used to
CC detect polymorphisms in the TACR1 gene

XX
XX The present invention relates to the use of enzymatic nucleic acid
CC molecules (e.g. ribozymes) to modulate gene expression. The invention
CC also methods for their use to down regulate or inhibit the expression of
CC genes encoding protein-tyrosine-phosphatase-1b (PTB-1b), methionine
CC aminopeptidase (MeAP-2), human telomerase (hTERT), protein kinase C
CC alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor
CC receptor-2 (HER2/C-erb2/neu), phospholamban (PLN), presenilin-1 (ps-1),
CC presenilin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic
CC nucleic acid molecules used to inhibit the expression of the said genes
CC include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberyne,
CC zinzyne, and/or DNazyme motifs. The methods of the invention are useful
CC for treating cancer, in particular breast cancer, Alzheimer's disease,
CC diabetes, obesity, cardiac diseases e.g. heart disease, age-related
CC diseases, hepatitis B infections, and hepatitis and hepatocellular
CC carcinoma. The enzymatic nucleic acid molecules can also be used as
CC diagnostic tools to examine genetic drift and mutations within diseased
CC cells and to detect the presence of specific RNA in a cell. The present
CC sequence represents a substrate/target sequence for a ribozyme used in
CC the examples of the present invention. Note: Some SEQ ID Nos are repeated

CC more than once in the specification, but these have different sequences
CC associated with them.

 PT Nucleic acid molecules, e.g., enzymatic, nucleic acids and antisense
 PT constructs, which down regulate expression of a CD20 gene or neurite
 PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
 PT central nervous system injury.
 XX
 XX
 PS Claim 30; Page 154; 200pp; English.
 CC The invention relates to a nucleic acid molecule which down regulates
 CC expression of a CD20 gene and a nucleic acid molecule which down
 CC regulates expression of a neurite growth inhibitor gene (NOCO). The
 CC nucleic acids may be enzymatic nucleic acids (e.g., a ribozyme or a
 CC DNazyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule
 CC possessing an NGN motif), a G-cleaver (cleaving RNA with a NYN motif) or
 CC an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
 CC with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA
 CC of CD20 in the presence of a divalent cation that is preferably Mg²⁺.
 CC Furthermore, it may be contacted with a cell to reduce CD20 activity of
 CC the cell and treat a patient having a condition associated with the level
 CC of CD20. The treatment may further comprise the use of one or more
 CC therapiers. In particular, the CD20 targeting nucleic acid may be used to
 CC treat lymphoma, leukemia, B-cell lymphoma, low-grade or follicular non-
 CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
 CC leukemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
 CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
 CC immune thrombocytopenia, and inflammatory arthropathy. The NOCO-
 CC targeting nucleic acid is used to cleave RNA of the NOCO gene in the
 CC presence of a divalent cation that is preferably Mg²⁺. Furthermore, the
 CC nucleic acid may be contacted with a cell to reduce NOCO activity of the
 CC cell and treat a patient having a condition associated with the level of
 CC NOCO. The treatment may further comprise the use of one or more
 CC therapiers. In particular, the NOCO-targeting nucleic acid may be used to
 CC treat central nervous system (CNS) injury and cerebrovascular accident
 CC (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
 CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
 CC Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
 CC disease, muscular dystrophy, and/or other neurodegenerative disease
 CC states which respond to the modulation of NOCO expression. The present
 CC sequence is a zinzyme molecule of the invention

XX Treating pathological condition involving neurokinin receptor-1, e.g.
PT pain or inflammation, by administering oligonucleotide or a non-
PT nucleotide disruptor compound which modulate NK-1 receptor biosynthetic
PT pathway.
XX
XX Claim 24; Page 65; 100pp; English.
XX
XX The invention relates to a method of treating a pathological condition
CC characterised partially by involvement of neurokinin receptor-1 (NK-1)
CC receptor, especially treating, attenuating or preventing pain or
CC inflammatory condition. The method comprises administering to a mammal, a
CC compound chosen from an oligonucleotide, its analogue, and a disruptor
CC which interferes with function or production of NK-1 receptors. The
CC method is useful for treating a pathological condition characterised by
CC involvement of NK-1 receptor such as dermatological, immune, autoimmune,
CC cardiovascular, vascular disorders (e.g. migraine), airway, neuropathic,
CC psychiatric and central nervous system disorders (e.g. anxiety,
CC psychosis, schizophrenia), gut inflammation, arthritis, and central or
CC peripheral aspects of chronic or acute pain, and for treating,
CC attenuating or preventing pain or inflammation such as peripheral,
CC chronic, acute pain or inflammation, neuropathic pain, inflammation or
CC pain relating to psychiatric disorders and central nervous system
CC disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia
CC in a mammal, in particular human. NK-1 receptor related disorders,
CC diseases, or pathological conditions treatable by this method include
CC respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic
CC conditions (e.g. conjunctivitis), cutaneous/dermatological conditions
CC (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and
CC Crohn's disease), cardiovascular conditions (stroke), chronic
CC gastrointestinal tract inflammation, and inflammatory diseases such as
CC inflammatory bowel diseases. Other disorders and diseases include
CC cardiovascular pathologies including stroke, chronic inflammatory
CC diseases such as rheumatoid arthritis, demyelinating diseases such as
CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity
CC disorders such as allergies and poison ivy, vasospastic diseases such as
CC angina, addiction disorders such as alcoholism, neurodegenerative
CC disorders such as acquired immune deficiency syndrome (AIDS) related
CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
CC disorders such as peripheral neuropathy, oedema, stress related and
CC somatic disorders, and osteoarthritis. Antisense oligonucleotides
CC effectively treat chronic conditions and other pathological states
CC without the co-administration of substance P, and reduce the number of
CC activated receptors while not reducing the number of quiescent NK-1
CC receptors. Receptors not chronically stimulated are less affected.
CC reducing side effects of treatment. ABK63841-ABK63906 represent NK-1
CC receptor coding sequences and oligonucleotides of the invention

 XX
 PT Novel enzymatic nucleic acid molecules which down regulates expression of
 PT a sequence encoding a subunit of nuclear factor kappa B useful for
 PT treating cancer, inflammatory disorders and autoimmune diseases.
 XX
 PS Claim 3; Page 39; 72pp; English.
 XX
 XX The invention describes an enzymatic nucleic acid molecule (I) which down
 CC regulates expression of a sequence encoding a subunit of nuclear factor
 CC kappa B (NFKB), where (I) is an inozyme, zinczyme, G-cleaver or amberyase
 CC configuration. The enzymatic nucleic acid molecule is adapted to treat
 CC cancer and is useful for down-regulating REL-A activity in a cell, for
 CC treating a patient having a condition associated with the level of REL-A.
 CC (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in
 CC the presence of a divalent cation, especially Mg²⁺. The enzymatic and
 CC antisense nucleic acid molecules are useful for treating breast, lung,
 CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,
 CC cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or
 CC multidrug resistant cancer. The method involves use of other drug
 CC chemotherapies such as monoclonal antibodies, REL-A-specific inhibitors or
 CC cyclophosphamide, doxorubicin, fluorouracil carboplatin, edatrexate,
 CC gemcitabine or radiation therapy. The enzymatic and antisense nucleic
 CC acid molecules are also useful for treating inflammatory disease such as
 CC rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,
 CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
 CC rejection, gene therapy applications, ischaemia/reperfusion injury,
 CC (central nervous system (CNS) and myocardial), glomerulonephritis,
 CC sepsis, allergic airway inflammation, inflammatory bowel disease or
 CC infection. This sequence represents the substrate of a novel enzymatic
 CC nucleic acid molecule

 PT Novel short interfering RNA and enzymatic nucleic acid useful for
 PT treating cancer, modulates the expression of a nucleic acid encoding
 PT HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
 XX
 PS Claim 58; Page 110; 185pp; English.
 XX
 XX The invention relates to a novel short interfering RNA (siRNA) nucleic
 CC acid molecule or an enzymatic nucleic acid molecule, that modulates
 CC expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras,
 CC human immunodeficiency virus (HIV) or a component of HIV. The nucleic
 CC acid molecule of the invention has cytoskeletal, anti-HIV, and anti-
 CC rheumatic activity. The nucleic acid molecules are useful for reducing
 CC HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are
 CC also useful for treating breast, ovarian, colorectal, lung, prostate,
 CC bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences
 CC shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ6520 - ABZ6524,
 CC ABZ6530 - ABZ6585 represent substrate/target sequences for the human
 CC ribozymes of the invention

PT Diagnosing glioma by detecting expression product of any one of 255
PT genes, glioma endothelial markers, in brain tissue sample suspected of
PT being neoplastic, and comparing the expression with expression in normal
PT brain tissue sample.
XX
XX
PS Example 2; SEQ ID NO 441; 114pp; English.
XX
CC The present invention describes a method (M1) for aiding in the diagnosis
CC of glioma. (M1) involves detecting an expression product of at least one
CC gene (I) in a first brain tissue sample (T) suspected of being
CC neoplastic, where (I) is chosen from any one of 255 genes (glioma
CC endothelial markers (GEMs)) as given in specification, and comparing the
CC expression of (I) in (T) with expression of (I) in a second normal brain
CC tissue sample (R), where increased expression of (I) in (T) relative to
CC (R), identifies (T) as likely to be neoplastic. Also described: (1)
CC treating (M2) glioma involves contacting cells of the glioma with an
CC antibody that specifically binds to a extracellular epitope; (2)
CC identifying (M3) a test compound as potential anticancer or antiglioma
CC drug involves contacting a test compound with the cell which expresses
CC (I), monitoring an expression product of the at least one gene and
CC identifying test compound as a potential anticancer drug if it decreases
CC the expression of at least one gene; (3) identifying (M4) a test compound
CC as potential anticancer or antiglioma drug involves contacting a test
CC compound with the cell which expresses mRNA of at least one gene
CC identified by a tag as described above, monitoring mRNA of the gene, and
CC identifying the test compound as a potential anticancer drug if it
CC decreases the expression of at least one gene; and (4) inducing (M5) an
CC immune response to glioma involves administering to a mammal, a protein
CC or (I). (I) have cytostatic activities, and can be used to trigger immune
CC destruction of glioma cells, and as immune response inducers. (M1) is
CC useful for aiding in diagnosing glioma. (M2) is useful for treating multi-
CC drug sensitive glioma in a human. (M5) is useful for inducing an immune
CC response to a glioma in a mammal having glioma or in a mammal who has had
CC a glioma surgically removed. The present sequence represents a human GEM
CC long tag oligonucleotide, which is used in the exemplification of the
CC present invention.

XX Novel double-stranded short interfering RNA molecule having first
PT nucleotide sequence complementary to RNA encoding HER2 or its portion,
PT and second nucleotide sequence having complementarity to first sequence,
PT useful for treating cancer.
XX Example 1; SEQ ID NO 1302; 143pp; English.
XX The invention relates to a double-stranded short interfering RNA (siRNA)
CC molecule (I) comprising a first nucleotide sequence having 19-23
CC nucleotides complementary to an RNA sequence encoding HER2 or its
CC portion, and a second nucleotide sequence having 19-23 nucleotides
CC exhibiting complementarity to the first sequence, and including at least
CC one nucleotide that is not a 2'-OH containing ribonucleotide. Also
CC described is a method of producing a class of nucleic acid-based gene
CC modulating agents that exhibit a high degree of specificity for RNA of a
CC desired target. (I) is useful for modulating HER2 activity in a cell, and
CC for treating diseases or conditions related to levels of HER2 gene
CC expression. (I) is useful for treating cancer, such as pancreatic cancer,
CC bladder cancer, lung cancer, breast cancer or prostate cancer. The
CC present sequence represents a human K-Ras substrate RNA sequence for a
CC DNAzyme (ribozyme), which is used in an example from the present
CC invention for the identification of potential target sites in human Ras
CC RNA.

PT - contg. regulatory element and a cytokine-sensitive promoter operably
PT linked to a heterologous gene.
XX
XX
XX Example 1; Page 26; 72pp; English.
PS
XX
XX A novel DNA construct comprises the present oligonucleotide (ON), which
CC contains a core a regulatory element, operably linked to a promoter,
CC which is operably linked to a heterologous gene (preferably a marker
CC gene). The gene is under the transcriptional control of the promoter and
CC the ON sequence when the ON is bound by a STAT protein activated in
CC response to IL-2, IL-3, G-CSF, GM-CSF, erythropoietin, thrombopoietin, or
CC preferably IL-4, IL-7, IL-9, IL-13 or IL-15. Cytokine responsive host
CC cells transfected with the DNA construct can be used to measure the
CC ability of a compound to act as an agonist or antagonist of cytokine
CC mediated gene transcription. In particular, they can be used to screen
CC for cytokine modulators involved in the STAT5 and/or STAT6 protein
CC signalling pathway. Following an electrophoretic mobility shift assay the
CC DNA construct was found to bind IL-4 moderately and IL-13 not determined

PT Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
PT stability - useful for treating e.g. tumour angiogenesis, psoriasis,
PT rheumatoid arthritis, etc., in a human patient.
XX
PS Claim 4; Page 152; 218pp; English.
XX
CC The present invention describes nucleic acid molecules which modulate the
CC synthesis, expression and/or stability of a mRNA encoding 1 or more
CC receptors of vascular endothelial growth factor (VEGF). A patient
CC (preferably human) having a condition associated with the level of the
CC fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
CC receptor (KDR) and/or foetal liver kinase 1 (Flk-1) (e.g. tumour
CC angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
CC treated by administering the nucleic acid molecule or the expression
CC vector to the patient. AAX67275 to AAX75752 represent specific examples
CC of nucleic acid molecules from the present invention

PT Nucleic acid encoding embryo-derived interleukin-related factors.
XX
PS Example 2; Page 75; 116pp; English.
XX
CC This sequence is a PCR primer for DNA encoding the embryo-derived
CC interleukin-related factor (EDIRF) of the invention, designated human
CC EDIRF II. The EDIRF DNA and protein sequences (and their homologues),
CC antibodies (Ab) specific for EDIRF, and other modulators are used; (i) in
CC screening and detection assays, e.g. for chromosome mapping, tissue
CC typing or forensic studies; (ii) in diagnosis, prognosis or monitoring
CC clinical trials; and (iii) for treating or preventing EDIRF-related
CC diseases (especially immune, haematopoietic, differentiative,
CC developmental or inflammatory disease, including arthritis and psoriasis.

CC The EDIRF coding sequence, or its fragments, are also useful as probes
CC and primers (for detecting related sequences and disease-associated
CC mutations, also for mutagenesis), for expressing recombinant EDIRF and as
CC source of antisense, ribozyme and peptide nucleic acids for inhibiting
CC translation of EDIRF-derived mRNA. EDIRF is used to raise Ab (useful for
CC detecting EDIRF, including forms with aberrant post-translational
CC modification, for affinity purification and therapeutically) and to
CC screen for specific modulators (e.g. peptides or peptidomimetics)

XX
XX New antisense compound that inhibits human integrin beta3, useful e.g.
XX for treating or preventing infection, inflammation and tumors.
XX
PS Claim 1; Col 39; 33pp; English.
XX
CC Sequences AAA07035-A07074 represent antisense oligonucleotides targeted
CC to the human integrin beta 3 gene, which inhibit its expression. The
CC antisense oligonucleotides were designed to target different regions of
CC the human integrin beta 3 RNA, and were analysed for their effect on
CC integrin beta 3 mRNA levels by quantitative real-time PCR. GAPDH
CC (glyceraldehyde-3-phosphate) mRNA levels were measured as a control.
CC Integrins constitute one of four classes of cellular adhesion molecules,
CC and play an important role in cell migration, cell anchorage to
CC substrates and cytoadhesion signalling pathways. They are heterodimeric
CC cation-dependent membrane glycoproteins composed of an alpha and beta
CC subunit. Integrin beta 3 (also known as human endothelial glycoprotein,
CC GP3A, GPIIb, ITGB3, C6b1 and platelet glycoprotein 3a) is the common
CC beta subunit partner of the members of the beta-3 subfamily of integrins.
CC This family consists of the vitronectin receptor (alpha-v-beta-3) and the
CC fibronectin receptor (alpha-1b-beta-3). Cells expressing this class of
CC integrin can adhere to various matrix proteins and participating in various
CC cytoadhesion-driven cellular responses. Integrin beta 3 is implicated in

CC conditions such as vascular stenosis, excessive bone resorption,
CC angiogenesis (in melanoma), tumour invasion, platelet aggregation and
CC Glanzmann's thrombasthenia. The oligonucleotides of the invention are
CC useful for diagnosis, prevention and treatment of conditions associated
CC with integrin beta 3 expression, such as tumour formation, inflammation,
CC infections and the diseases mentioned above

PT Antisense inhibition of the human Smad3 gene, useful for diagnosing,
PT preventing and treating conditions associated with Smad3 expression e.g.
PT inflammation.
XX
PS Claim 11; Col 38; 31pp; English.
XX
CC Sequences AAZ49796-259835 represent antisense oligonucleotides targeted
CC to the human Smad3 gene, which inhibit its expression. The antisense
CC oligonucleotides were designed to target different regions of the human
CC Smad3 RNA, and were analysed for their effect on Smad3 mRNA levels by
CC quantitative real-time PCR. The Smad proteins are a family of cytosolic
CC proteins which are involved in TGF-beta superfamily signal transduction.
CC On ligand binding, TGF-beta superfamily proteins (such as bone
CC morphogenetic protein (BMP), activin and TGF-betas themselves)
CC phosphorylate Smad proteins, which then homo- or heterodimerise and
CC translocate to the nucleus to activate target gene transcription. Smad3
CC (also known as MADH3, hMAD3 and JVI5-2) is a member of a subgroup of Smad
CC family transcription factors, the pathway-restricted Smads, which are
CC regulated by TGF-beta and activins. It can heterodimerise with Smad4
CC (US6013787-A, AAY69622), the complex being able to activate TGF-beta
CC inducible transcription. The oligonucleotides of the invention are useful
CC for diagnosis, prevention and treatment of conditions associated with
CC Smad3 expression, such as tumour formation, inflammation and certain
CC infections

 XX

CC Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide
 CC primer extension (SNP) primers, and the sequences of regions flanking
 CC sites of single nucleotide polymorphisms SNPs. The present invention
 CC includes kits for determining the presence or absence of a SNP, using the
 CC oligonucleotides of the invention. The PCR primers are used to amplify a
 CC SNP flanking sequence, the SNP primer is used as a genotyping primer.
 CC The oligonucleotides are useful for genotyping a nucleic acid sample by
 CC performing a single-nucleotide primer extension reaction. The
 CC oligonucleotides are useful for determining the presence, absence or
 CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to
 CC assess by association analysis the genotype of an individual or group of
 CC individuals, having a pathological phenotypic trait suspected of being
 CC caused by one or more SNPs. Phenotypic traits include diseases e.g.
 CC agammaglobulinaemia, diabetes insipidus, Leech-Nyhan syndrome, muscular
 CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease,
 CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic
 CC traits also include symptoms of or susceptibility to multifactorial
 CC disease of which a component is or may be genetic such as autoimmune
 CC diseases, including, rheumatoid arthritis, multiple sclerosis,
 CC inflammation, cancer, nervous system diseases and infection by pathogenic
 CC microorganism. The method is also useful in forensic investigations and
 CC paternity analysis. The present sequence represents a PCR primer specific
 CC for a human SNP containing DNA sequence

XX Treating pathological condition involving neurokinin receptor-1, e.g.
PT pain or inflammation, by administering oligonucleotide or a non-
PT nucleotide disruptor compound which modulate NK-1 receptor biosynthetic
PT pathway.
XX
PS Claim 24; Page 65; 100pp; English.
XX
XX The invention relates to a method of treating a pathological condition
CC characterised partially by involvement of neurokinin receptor-1 (NK-1)
CC receptor, especially treating, attenuating or preventing pain or
CC inflammatory condition. The method comprises administering to a mammal, a
CC compound chosen from an oligonucleotide, its analogue, and a disruptor
CC which interferes with function or production of NK-1 receptors. The
CC method is useful for treating a pathological condition characterised by
CC involvement of NK-1 receptor such as dermatological, immune, autoimmune,
CC cardiovascular, vascular disorders (e.g. migraine), airway, neuropathic,
CC psychiatric and central nervous system disorders (e.g. anxiety,
CC psychosis, schizophrenia), gut inflammation, arthritis, and central or
CC peripheral aspects of chronic or acute pain, and for treating,
CC attenuating or preventing pain or inflammation such as peripheral,
CC chronic, acute pain or inflammation, neuropathic pain, inflammation or
CC pain relating to psychiatric disorders and central nervous system
CC disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia
CC in a mammal, in particular human. NK-1 receptor related disorders,
CC diseases, or pathological conditions treatable by this method include
CC respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic
CC conditions (e.g. conjunctivitis), cutaneous/dermatological conditions
CC (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and
CC Crohn's disease), cardiovascular conditions (stroke), chronic
CC gastrointestinal tract inflammation, and inflammatory diseases such as
CC inflammatory bowel diseases. Other disorders and diseases include
CC cardiovascular pathologies including stroke, chronic inflammatory
CC diseases such as rheumatoid arthritis, demyelinating diseases such as
CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity
CC disorders such as allergies and poison ivy, vasospastic diseases such as
CC angina, addiction disorders such as alcoholism, neurodegenerative
CC disorders such as acquired immune deficiency syndrome (AIDS) related
CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
CC disorders such as peripheral neuropathy, edema, stress related and
CC somatic disorders, and osteoarthritis. Antisense oligonucleotides
CC effectively treat chronic conditions and other pathological states
CC without the co-administration of substance P, and reduce the number of
CC activated receptors while not reducing the number of quiescent NK-1
CC receptors. Receptors not chronically stimulated are less affected.
CC reducing side effects of treatment. ABK63834-ABK63906 represent NK-1
CC receptor coding sequences and oligonucleotides of the invention

CC The invention describes a method of identifying a human leukocyte antigen
CC (HLA) genotype of a subject comprising: obtaining a sample comprising a
CC template nucleic acid from the subject; amplifying the template nucleic
CC acid with HLA allele-specific forward primers and HLA allele-specific
CC reverse primers to form amplification products; hybridizing the
CC amplification products with an HLA locus-specific capture oligonucleotide
CC ; and detecting the detectable complexes to identify the HLA genotype of
CC the subject. The present sequence represents one of 276 HLA locus-
CC specific capture oligonucleotides of the invention.

PT Diagnosing, preventing and treating non-small cell lung cancer (NSCLC)
PT comprises determining an expression level of an NSCLC-associated gene in
PT a sample.

XX
PS Disclosure; SEQ ID NO 509; 394bp; English.

XX
CC The invention relates to a method of diagnosing non-small cell lung
CC cancer (NSCLC) or a predisposition to developing NSCLC in a subject by
CC determining the expression level of a NSCLC-associated gene in a
CC biological sample derived from the subject, where an increase or decrease
CC of the level compared to a normal control level of the gene indicates
CC that the subject suffers from or is at risk of developing NSCLC. The
CC method is useful in diagnosing NSCLC or a predisposition to developing
CC NSCLC in a subject. The compound, polynucleotide and the encoded
CC polypeptide and composition are useful in treating or preventing NSCLC.
CC This sequence corresponds to an antisense oligonucleotide of genes that
CC are differentially expressed in NSCLC cells.

 PT Treatment of airway diseases such as asthma - by topically applying
 PT adenosine-free antisense oligo:nucleotide to airway epithelium of
 PT subject.
 XX
 PS Example 5; Page 40; 71PP; English.
 XX
 CC A method for treating airway disease in a subject has been produced,
 CC which involves the topical administration of an essentially adenosine
 CC free antisense oligonucleotide (ON) to the airway epithelium of the
 CC subject. The present sequence is an antisense oligonucleotide specific
 CC for the substance P receptor. The method can be used to treat airway
 CC diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary
 CC disease, bronchitis and other airway diseases characterised by an
 CC inflammatory response. By eliminating adenosine from the antisense ON,
 CC its liberation upon antisense degradation is prevented, thereby
 CC preventing adenosine-induced bronchoconstriction in patients with hyper-
 CC reactive airways

PT New antisense oligonucleotides used in treatment of, e.g. pulmonary
PT vasoconstriction.
XX
PS Disclosure; Page 59; 120pp; English.
XX
PS The specification describes antisense oligonucleotides (AA52869-X55271)
CC directed against at least 2 mRNAs selected from target genes, coding and
CC non-coding regions of RNAs corresponding to target genes, gene initiation
CC codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-
CC end and the junction between coding and non-coding regions and all
CC segments of RNAs encoding proteins associated with one or more diseases,
CC conditions or mixtures. The antisense oligonucleotides may be derived
CC from sequences AA55272-74. These multiple target oligonucleotides
CC (specifically AA55180-271) can be used for the antisense treatment of
CC diseases and conditions. Typical diseases and conditions are those
CC associated with impaired respiration and inflammation, including lung
CC diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
CC acute asthma, allergies, asthma, impaired respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
CC pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
CC disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
CC colon cancer, breast cancer, lung cancer, pancreatic cancer,
CC hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
CC well as all types of cancers which may metastasize or have metastasized
CC to the lungs, including breast and prostate cancer

PT New antisense oligonucleotides useful for treating e.g. pulmonary
PT vasoconstriction, inflammation, allergies, asthma, hypertension,
PT bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT cancers.
XX
PS Claim 18; Page 436; 1343pp; English.
XX
PS The present invention describes a new composition comprising an antisense
CC oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC nucleic acids involved in bronchoconstriction, allergies, and/or
CC inflammation. The ON can have antiinflammatory, antiallergic,
CC antiaesthetic, cyostatic and analgesic activities. The compositions are
CC useful for the treatment of diseases associated with inflammation,
CC impaired airways, including lung disease and diseases whose secondary
CC effects afflict the lungs of a subject. They can be used for treating
CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC impaired respiration, respiratory distress syndrome, pain, cystic
CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC pulmonary disease (COPD), and cancers such as leukemias, lymphomas,
CC carcinomas, and cancers which may metastasize to the lungs, including
CC breast and prostate cancer. The reduction of the adenosine content of the
CC ONs reduces side effects. The A-containing ONs break down with the
CC release of deoxyadenosine which activates adenosine receptors causing
CC bronchoconstriction and inflammation. AA52313 to AA5312 represent the
CC nucleotide sequences given in the sequence listing from the present
CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC from the previously named sequences. SEQ ID NO:11 to 1680 (AA52323 to
CC AA53922) are specifically claimed ONs from the present invention. N.B.
CC Sequences given in the disclosure of the present invention do not match
CC up with their corresponding SEQ ID NO: sequences given in the sequence
CC listing

 DR Low adenosine (A) content antisense oligonucleotides which do not trigger
 PT adenosine receptors during metabolism, useful e.g. for treating cancers
 PT and respiratory obstructions.
 XX Claim 14; Page 245; 1592pp; English.
 PS The present invention describes low adenosine (A) content antisense
 CC oligonucleotides and compositions (i) comprising them. In the antisense
 CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
 CC (i) can have respiratory, bronchodilator, antiinflammatory, analgesic,
 CC immunosuppressive, antihistatic, hypotensive and cyostatic activities.
 CC The antisense oligonucleotides and (i) can be used to down-regulate the
 CC expression and/or activity of target polypeptides associated with
 CC lung/respiratory disorders and malignancies, such as stimulating and
 CC activating peptide factors and transmitters, transcription factors,
 CC immunoglobulins and antibodies, antibody receptors, cytokines and
 CC chemokines, endogenously produced specific and non-specific enzymes,
 CC binding proteins, adhesion molecules and their receptors, cytokine and
 CC chemokine receptors, adenosine receptors, bradykinin receptors, central
 CC nervous system (CNS) and peripheral nervous and non-nervous system peptide
 CC receptors, CNS and peripheral nervous and non-nervous system peptide
 CC transmitters, defensins, growth factors, vasoactive proteins. The
 CC receptors, binding proteins and malignancy associated proteins. The
 CC antisense oligonucleotides may be used in this way to treat disorders
 CC including respiratory obstruction (especially pulmonary obstruction
 CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
 CC surfactant hypoproduction which are associated with a disease or
 CC condition selected from pulmonary vasoconstriction, inflammation,
 CC allergies, asthma, impeded respiration, respiratory distress syndrome
 CC (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
 CC hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
 CC pulmonary transplantation rejection, pulmonary infections, bronchitis,
 CC and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
 CC fragments and antisense oligonucleotides used in the exemplification of
 CC the present invention

XX	
XX	Pharmaceutical composition for treating asthma, has antisense
XX	oligonucleotide containing less percentage of adenosine, targeted to
XX	nucleic acids associated with lung airway or lung dysfunction, and
XX	bronchodilating agent.
XX	
XX	Claim 15; SEQ ID NO 10740; 7633P; English.
XX	
XX	This invention describes a novel composition (a) a first active agent,
XX	comprising oligonucleotides, effective for alleviating
XX	bronchoconstriction, respiratory tract inflammation, allergies and
XX	reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
XX	surfactant depletion or hyposecretion, when administered to a mammal. The
XX	oligonucleotides are derived from a gene encoding or regulating
XX	expression of a target polypeptide associated with lung airway or lung
XX	dysfunction or cancer and can be anti-sense to the corresponding mRNA.
XX	The invention also describes a kit, that comprises: (a) a delivery
XX	device, in separate containers, (b) the oligonucleotides, (c)
XX	instructions for adding a carrier and for use of the kit. The composition
XX	of the invention has anti-allergic, anti-inflammatory, antiasthmatic, is a
XX	analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
XX	beta-adrenergic agonist. The composition is useful for preventing or
XX	creating a respiratory, lung or malignant disease. The administered
XX	composition comprises oligo and is administered to reduce the production
XX	or availability, or to increase the degradation of the target mRNA or to
XX	reduce the amount of target polypeptide present in the lungs. The
XX	pulmonary obstruction, and/or surfactant hypoproduction and/or lung
XX	inflammation, allergies and/or bronchoconstriction are associated
XX	with a disease or condition such as pulmonary vasoconstriction,
XX	inflammation, allergies, asthma, impeded respiration, respiratory
XX	distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
XX	hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
XX	transplantation rejection, pulmonary infections, bronchitis or cancer.
XX	The reduced adenosine content of the anti-sense oligos corresponding to
XX	thymidines present in the target RNA serves to prevent the breakdown of
XX	the oligonucleotides into products that free adenosine into the system
XX	e.g., lung, brain, heart, kidney, etc. tissue environment and thereby, to
XX	prevent any unwanted effects due to it

PT used as antiviral agents and synthons.
XX
XX
XX Claim 180; Page 177; 259pp; English.
XX
XX
XX A method has been developed for the identification of a nucleic acid
CC capable of modulating a process in a biological system. The method
CC comprises: (a) introducing into the system a random library of nucleic
CC acid catalyses (NAC) having a substrate binding domain (SBD), comprising
CC a random sequence, and a catalytic domain (CD); and (b) identifying NAC
CC in systems where modulation has occurred and/or determining the sequence
CC of at least part of the SBDs in such systems. Nucleic acid molecules with
CC endonuclease activity and catalytic activity, from the present invention,
CC are used to modulate gene expression in plant and mammalian cells and to
CC cleave target nucleic acid, particularly for treating systemic diseases
CC caused by infectious RNA, e.g. cancer, inflammation, psoriasis, non-hepatic
CC acetosis and infection. They may also be used to detect genetic drift and
CC mutations in diseased cells and to determine c-rat RNA. Specifically NACs
CC with RNA-cleaving activity that modulate expression of the Raf gene, are
CC used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
CC generally any condition associated with the level of c-rat. Introduction
CC of sugar/phosphate modifications increases stability against nuclease and
CC activity. AAV90922 to AAV93877 represent NACs that can be used in the
CC method, specifically for modulating the expression of a Raf gene

XX
XX Treating pathological condition involving neurokinin receptor-1, e.g.
PT pain or inflammation, by administering oligonucleotide or a non-
PT nucleotide disruptor compound which modulate NK-1 receptor biosynthetic
PT pathway.
XX
XX
XX Claim 24; Page 65; 100pp; English.
XX
XX
XX The invention relates to a method of treating a pathological condition
CC characterised partially by involvement of neurokinin receptor-1 (NK-1)
CC receptor, especially treating, attenuating or preventing pain or
CC inflammatory condition. The method comprises administering to a mammal, a
CC compound chosen from an oligonucleotide, its analogue, and a disruptor
CC which interferes with function or production of NK-1 receptors. The
CC method is useful for treating a pathological condition characterised by
CC involvement of NK-1 receptor such as dermatological, immune, autoimmune,
CC cardiovascular, vascular disorders (e.g. migraine), airway, neuropathic,
CC psychosocial and central nervous system disorders (e.g. anxiety,
CC psychosis, schizophrenia), gut inflammation, arthritis, and central or
CC peripheral aspects of chronic or acute pain, and for treating,
CC attenuating or preventing pain or inflammation such as peripheral,
CC chronic, acute pain or inflammation, neuropathic pain, inflammation or
CC pain relating to psychiatric disorders and central nervous system
CC disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia
CC in a mammal, in particular human. NK-1 receptor related disorders,
CC diseases, or pathological conditions treatable by this method include
CC respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic
CC conditions (e.g. conjunctivitis), cutaneous/dermatological conditions
CC (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and
CC Crohn's disease), cardiovascular conditions (stroke), chronic
CC gastrointestinal tract inflammation, and inflammatory diseases such as
CC cardiovascular pathologies including stroke, chronic inflammatory
CC diseases such as rheumatoid arthritis, demyelinating diseases such as
CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity
CC disorders such as allergies and poison ivy, vasospastic diseases such as
CC angina, addiction disorders such as alcoholism, neurodegenerative
CC disorders such as acquired immune deficiency syndrome (AIDS) related
CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
CC disorders such as peripheral neuropathy, oedema, stress related and
CC somatic disorders, and osteoarthritis. Antisense oligonucleotides
CC effectively treat chronic conditions and other pathological states
CC without the co-administration of substance P, and reduce the number of
CC activated receptors while not reducing the number of quiescent NK-1
CC receptors. Receptors not chronically stimulated are less affected.
CC reducing side effects of treatment. ABR63834-ABK63906 represent NK-1
CC receptor coding sequences and oligonucleotides of the invention

 XX Deleted in Pancreatic Cancer locus 4 polypeptide - and related nucleic
 PT acids, used in diagnosis and treatment of proliferative diseases, e.g.
 PT cancer of pancreas or other organs.
 XX
 XX Example 2; Page 56; 104pp; English.
 PS
 XX The present sequence represents a sequence tagged site (STS) primer used
 CC in the isolation of cosmids from the DPC4 (deleted in pancreatic cancer,
 CC locus 4) region, and gene identification. DPC4 is a tumour suppressor
 CC gene. Detection of truncated DPC4 protein, or of homozygous deletions or
 CC intragenic mutations in nucleic acid encoding it, is used to diagnose (in
 CC vivo or in vitro) proliferative diseases, especially pancreatic
 CC carcinoma, bile duct, bladder or colorectal cancer, Crohn's disease,
 CC colitis-associated neoplasia or chronic ulcerative colitis. These
 CC conditions, where associated with a homozygous deletion, can be treated
 CC by administering an agent that: (a) modulates DPC4 expression,
 CC specifically a sense DPC4 sequence (particularly in the form of a vector,
 CC i.e. by gene therapy), but also an antisense sequence where DPC4 protein
 CC is over expressed or (b) mimics the activity of DPC4. DPC4 nucleic acid
 CC is also used as hybridisation probes for detecting presence/absence of
 CC human chromosome 18q21.1 fragments. When a homozygous deletion is
 CC detected in this region, an agent can be administered that accumulates
 CC within, or kills, only cells which contain such a deletion. This agent
 CC exploits the absence of an enzyme (or other protein) encoded by a
 CC neighbouring gene and lost by the deletion, i.e. it has a highly
 CC selective action

XX	
PT	Purified beta-secretase protein used in assays to discover inhibitors
PT	which can be used for the treatment of amyloidogenic diseases e.g.
PT	Alzheimer's disease.
XX	
XX	Example 3; Page 66; 121pp; English.
XX	
CC	The specification describes a beta-secretase enzyme. The enzyme cleaves
CC	beta-amyloid precursor protein to produce beta-amyloid peptide. This
CC	enzyme is therefore implicated in the production of amyloid plaque
CC	components which accumulate in the brains of individuals afflicted with
CC	Alzheimer's disease. Inhibitors of beta-secretase are administered to a
CC	mammalian subject e.g. with Alzheimer's disease or Alzheimer's disease-
CC	like pathology to test if they maintain or improve cognitive ability or
CC	reduce the plaque burden. The compounds are used for the treatment of
CC	amyloidogenic diseases e.g. Alzheimer's disease. PCR primers AAA59530-49
XX	were used to amplify DNA encoding beta-secretase enzyme

XX Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
XX constructs, which down regulate expression of a CD20 gene or neurite
PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
PT central nervous system injury.
PS
XX Claim 30; Page 159; 200pp; English.
XX The invention relates to a nucleic acid molecule which down regulates
XX expression of a CD20 gene and a nucleic acid molecule which down
XX regulates expression of a neurite growth inhibitor gene (NGO). The
XX nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
XX DNAzyme) an inozyme (an endolytic nucleic acid cleaving an RNA molecule
XX possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or
XX an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
XX with a XGY motif). The CD20-targeting nucleic acid is used to cleave RNA
XX of CD20 in the presence of a divalent cation that is preferably Mg²⁺.
XX Furthermore, it may be contacted with a cell to reduce CD20 activity of
XX the cell and treat a patient having a condition associated with the level
XX of CD20. The treatment may further comprise the use of one or more
XX therapies. In particular, the CD20 targeting nucleic acid may be used to
XX treat lymphoma, leukemia, B-cell lymphoma, low-grade or follicular non-
XX Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
XX leukemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
XX lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
XX immune thrombocytopenia, and inflammatory arthropathy. The NGO-
XX targeting nucleic acid is used to cleave RNA of the NGO gene in the
XX presence of a divalent cation that is preferably Mg²⁺. Furthermore, the
XX nucleic acid may be contacted with a cell to reduce NGO activity of the
XX cell and treat a patient having a condition associated with the level of
XX NGO. The treatment may further comprise the use of one or more
XX therapies. In particular, the NGO-targeting nucleic acid may be used to
XX treat central nervous system (CNS) injury and cerebrovascular accident
XX (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
XX chemothrapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
XX Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
XX disease, muscular dystrophy, and/or other neurodegenerative disease
XX states which respond to the modulation of NGO expression. The present
XX sequence is a DNAzyme molecule of the invention

XX New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins,
PT or as specific biomolecule capture probes for surface-enhanced laser
PT desorption ionization, comprises human myosin-like protein hGDMLP-1.

PS Disclosure; SEQ ID NO 6969; 214pp; English.

XX The present invention describes a human genome-derived myosin-like
CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC nucleic acids can be used as probes to detect, characterise and quantify
CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC provide initial substrates for the recombinant engineering of hGDMLP-1
CC protein variants having desired phenotypic improvements, and for
CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC used as immunogens to raise antibodies that specifically recognise hGDMLP
CC -1 proteins, as standards in assays used to determine the concentration
CC and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC capture probes for surface-enhanced laser desorption/ionization, as
CC therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC production, and in vaccines or for replacement therapy. The
CC polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC disorder associated with the expression of hGDMLP-1, in particular heart
CC and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC The present sequence represents an oligomer used in the screening of the
CC hGDMLP-1 sequence for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequence

XX New polypeptide, for raising antibodies that recognise hGDMLP-1 proteins,
PT or as specific biomolecule capture probes for surface-enhanced laser
PT desorption ionization, comprises human myosin-like protein hGDMLP-1.
XX
XX Disclousure; SEQ ID NO 6965; 214pp; English.
XX
XX
XX The present invention describes a human genome-derived myosin-like
CC protein 1 (hGDMLP-1). The protein and vaccine production. The hGDMLP-1
CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC nucleic acid can be used as probes to detect, characterise and quantify
CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC provide initial substrates for the recombinant engineering of hGDMLP-1
CC protein variants having desired phenotypic improvements, and for
CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC used as immunogens to raise antibodies that specifically recognise hGDMLP
CC -1 proteins, as standards in assays used to determine the concentration
CC and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC capture probes for surface-enhanced laser desorption ionisation, as
CC therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC production, and in vaccines or for replacement therapy. The
CC polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC disorder associated with the expression of hGDMLP-1, in particular heart
CC and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC The present sequence represents an oligomer used in the screening of the
CC hGDMLP-1 sequence in the exemplification of the present invention. N.B.
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ffp.wipo.int/pub/published_pcc_sequence

PT leukemia.
XX
XX
XX Claim 4; SEQ ID NO 398; 74pp; English.
XX
XX
XX The invention relates to a nucleic acid molecule that down-regulates
CC expression of Grb2-related with insert domain (GRID) gene, e.g. a
CC hammerhead ribozyme, NCH ribozyme, G-cleaver ribozyme, Zinzyne, DNAzyme,
CC amberyne, inozyme or hairpin ribozyme. Also include are a mammalian cell
CC including the novel nucleic acid molecule, reducing GRID activity in a
CC cell by contacting the cell with the novel nucleic acid molecule,
CC treating a patient having a condition associated with the level of GRID
CC (e.g. tissue/graft rejection or leukaemia) by contacting the cell with
CC the novel nucleic acid molecule, cleaving RNA of a GRID gene by
CC contacting the cell with the novel nucleic acid molecule, an expression
CC vector comprising a nucleic acid sequences (encoding at least the novel
CC nucleic acid molecule in a manner that allows its expression), a
CC mammalian cell including the expression vector and an enzymatic nucleic
CC acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid
CC molecule is useful for treating a condition associated with the level of
CC GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is
CC a target region for the enzymatic nucleic acids of the invention.

XX PT Assessing propensity for marbling in animal meat useful for selecting
XX PT animal to improve marbling in herd, involves detecting alleles of
XX PT retinoid related orphan receptor C gamma gene associated with increased
XX PT fat deposition in muscle.
XX PS Disclosure; SEQ ID NO 10; 53pp; English.
XX CC The present invention relates to a method for assessing the propensity
XX CC for marbling in meat derived from an animal. The method involves testing
XX CC the animal for the presence or absence of one or more alleles of the gene
XX CC encoding the retinoid related orphan receptor C (gamma) (RORC) also known
XX CC as RAR-related orphan receptor gamma, nuclear receptor ROR-gamma and
XX CC retinoic acid-binding receptor gamma, associated with increased fat
XX CC deposition in muscle tissue and genetic variation located external to the
XX CC RORC gene which shows allelic association with it. The invention is
XX CC useful for selection and breeding of animal with improved fat deposition
XX CC characteristics, particularly high marbling scores. The present sequence
XX CC is bovine RORC allelic variant, RORCGH DNA specific PCR primer.

PT polymorphism (SNP), useful for diagnosing or treating autoimmune
PT diseases, e.g. rheumatoid arthritis.
XX
XX Claim 21; SEQ ID NO 6617; 123pp; English.
XX
XX The invention comprises amino acid and coding sequences containing
CC genetic polymorphisms associated with an altered risk of developing an
CC autoimmune disease (e.g. rheumatoid arthritis). The invention further
CC comprises a method of identifying an individual that has an altered risk
CC of developing an autoimmune disease, comprising detecting a single
CC nucleotide polymorphism (SNP) in a nucleic acid of the invention. The DNA
CC and protein sequences of the invention are useful for diagnosing and
CC treating autoimmune diseases, such as: rheumatoid arthritis, type 1
CC diabetes, multiple sclerosis, systemic lupus erythematosus, inflammatory
CC bowel diseases, psoriasis, thyroiditis, celiac disease, pernicious
CC anaemia, asthma, vitiligo, glomerulonephritis, Grave's disease,
CC myocarditis, Sjogren's disease, or primary systemic vasculitis. The
CC present DNA sequence represents a human autoimmune disease-related PCR
CC primer of the invention. NOTE: The present sequence is not shown in the
CC specification, but has been retrieved from the WIPO website.

XX Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
PT stability - useful for treating e.g. tumour angiogenesis, psoriasis,
PT rheumatoid arthritis, etc., in a human patient.
XX
XX Claim 4; Page 108; 218pp; English.
XX
XX The present invention describes nucleic acid molecules which modulate the
CC synthesis, expression and/or stability of a mRNA encoding 1 or more
CC receptors of vascular endothelial growth factor (VEGF). A patient
CC (preferably human) having a condition associated with the level of the
CC fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
CC receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
CC angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
CC treated by administering the nucleic acid molecule or the expression
CC vector to the patient. AAx67275 to AAx75752 represent specific examples

XX
XX Enzymatic nucleic acids - which cleave RNA derived from an epidermal
PT growth factor receptor, useful for inhibiting cell proliferation and for
PT treating cancers.
XX
XX
XX Claim 5; Page 73; 109pp; English.
XX
XX The present invention describes enzymatic nucleic acid molecules (NMs)
CC which specifically cleave RNA derived from an epidermal growth factor
CC receptor (EGF-R) gene. AAV97221 to AAV98043 and AAV98979 to AAV99090
CC represent specifically claimed target sequence from human EGF-R. AAV98044
CC to AAV98866 and AAV98867 to V9878 represent hammerhead ribozymes and
CC hairpin ribozymes respectively for human EGF-R. The NMs are useful for
CC cleaving EGF-R RNA in the treatment of a condition associated with EGFR
CC expression levels e.g. to inhibit cell proliferation in the prevention or
CC treatment of cancers. The NMs can also be used as diagnostic tools to
CC examine genetic drift and mutations within diseased cells or to detect
CC the presence of EGF-R RNA in a cell

XX Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
PT constructs, which down regulate expression of a CD20 gene or neurite
PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
PT central nervous system injury.
PI

XX Claim 88; Page 92; 200pp; English.
XX

XX The invention relates to a nucleic acid molecule which down regulates
CC expression of a CD20 gene and a nucleic acid molecule which down
CC regulates expression of a neurite growth inhibitor gene (NOGO). The
CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a

CC DNazyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule
CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr
CC an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
CC with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA
CC of CD20 in the presence of a divalent cation that is preferably Mg^{2+} .
CC Furthermore, it may be contacted with a cell to reduce CD20 activity of
CC the cell and treat a patient having a condition associated with the level
CC of CD20. The treatment may further comprise the use of one or more
CC therapies. In particular, the CD20 targeting nucleic acid may be used to
CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
CC leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
CC immune thrombocytopenia, and inflammatory arthropathy. The NOGO-
CC targeting nucleic acid is used to cleave RNA of the NOGO gene in the
CC presence of a divalent cation that is preferably Mg^{2+} . Furthermore, the
CC nucleic acid may be contacted with a cell to reduce NOGO activity of the
CC cell and treat a patient having a condition associated with the level of
CC NOGO. The treatment may further comprise the use of one or more
CC therapies. In particular, the NOGO-targeting nucleic acid may be used to
CC treat central nervous system (CNS) injury and cerebrovascular accident
CC (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
CC Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
CC disease, muscular dystrophy, and/or other neurodegenerative disease
CC states which respond to the modulation of NOGO expression. The present
CC sequence is a G-cleaver molecule of the invention

XX
CC The invention relates to a nucleic acid molecule which down regulates
CC expression of a CD20 gene and a nucleic acid molecule which down
CC regulates expression of a neurite growth inhibitor gene (NOGO). The
CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
CC DNazyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule
CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr
CC an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
CC with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA
CC of CD20 in the presence of a divalent cation that is preferably Mg^{2+} .
CC Furthermore, it may be contacted with a cell to reduce CD20 activity of
CC the cell and treat a patient having a condition associated with the level
CC of CD20. The treatment may further comprise the use of one or more
CC therapies. In particular, the CD20 targeting nucleic acid may be used to
CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
CC leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
CC immune thrombocytopenia, and inflammatory arthropathy. The NOGO-
CC targeting nucleic acid is used to cleave RNA of the NOGO gene in the
CC presence of a divalent cation that is preferably Mg^{2+} . Furthermore, the
CC nucleic acid may be contacted with a cell to reduce NOGO activity of the
CC cell and treat a patient having a condition associated with the level of
CC NOGO. The treatment may further comprise the use of one or more
CC therapies. In particular, the NOGO-targeting nucleic acid may be used to
CC treat central nervous system (CNS) injury and cerebrovascular accident
CC (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
CC Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
CC disease, muscular dystrophy, and/or other neurodegenerative disease
CC states which respond to the modulation of NOGO expression. The present
CC sequence is an amberzyme molecule of the invention

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
constructs, which down regulate expression of a CD20 gene or neurite
growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
central nervous system injury.

Claim 88; Page 131; 200P; English.

The invention relates to a nucleic acid molecule which down regulates
expression of a CD20 gene and a nucleic acid molecule which down
regulates expression of a neurite growth inhibitor gene (NODG). The
nucleic acid may be enzymatic nucleic acids (e.g. a ribozyme or a
DNAzyme) and inozyme (an endolytic nucleic acid cleaving an RNA molecule
possessing an NCH motif), a G-cleaver (cleaving RNA with a NTR motif) or
an amberyze (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
with a VGY motif). The CD20-targeting nucleic acid is used to cleave RNA
of CD20 in the presence of a divalent cation that is preferably Mg²⁺.
Furthermore, it may be contacted with a condition associated with the level
of CD20. The treatment may further comprise the use of one or more
therapies. In particular, the CD20 targeting nucleic acid may be used to
treat lymphoma, leukemia, B-cell lymphoma, low-grade or follicular NHL, lymphocytic
Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, mantle-cell
leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
immune thrombocytopenia, and inflammatory arthropathy. The NODG-
targeting nucleic acid is used to cleave RNA of the NODG gene in the
presence of a divalent cation that is preferably Mg²⁺. Furthermore, the
nucleic acid may be contacted with a cell to reduce NODG activity of the
cell and treat a patient having a condition associated with the level of
NODG. The treatment may further comprise the use of one or more
therapies. In particular, the NODG-targeting nucleic acid may be used to
treat central nervous system (CNS) injury and cerebrovascular accident
(CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
disease, muscular dystrophy, and/or other neurodegenerative disease
states which respond to the modulation of NODG expression. The present
sequence is an amberyze molecule of the invention

XX
XX New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins,
PT or as specific biomolecule capture probes for surface-enhanced laser
PT desorption ionization, comprises human myosin-like protein hGDMLP-1.
XX
XX Disclosure; SEQ ID NO 2756; 214bp; English.
XX
XX The present invention describes a human genome-derived myosin-like
CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC nucleic acids can be used as probes to detect, characterise and quantify
CC hGDMLP-1 nucleic acids in samples, as amplification substrates; to
CC provide initial substrates for the recombinant engineering of hGDMLP-1
CC protein variants having desired phenotypic improvements, and for
CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC used as immunogens to raise antibodies that specifically recognise hGDMLP
CC -1 proteins, as standards in assays used to determine the concentration
CC and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC capture probes for surface-enhanced laser desorption ionisation, as
CC therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC production, and in vaccines or for replacement therapy. The
CC polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC disorder associated with the expression of hGDMLP-1, in particular heart
CC and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC The present sequence represents an oligomer used in the screening of the
CC hGDMLP-1 sequence in the exemplification of the present invention. N.B.
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequence

XX
XX New human kidney tumor overexpressed membrane (KTOM1) protein and nucleic
PT acids encoding the protein, useful for treating subjects having defects
PT in KTOM1 which can manifest as cancer of the kidney, or as a disorder of
PT e.g., liver or bone.
XX
XX Example 2; Page 194; 418bp; English.
XX
XX The invention relates to a novel isolated nucleic acid encoding human
CC KTOM1 (kidney tumour overexpressed membrane) protein. The protein of the
CC invention has cytostatic activity. The nucleotide may have a use in gene
CC therapy. The KTOM1 nucleic acids may be used to diagnose, treat or
CC monitor a disease caused by altered expression of human KTOM1.
CC Compositions comprising the nucleic acids, proteins or antibodies may be
CC used to treat subjects having defects in KTOM1 which can manifest as
CC cancer of the kidney, as well as a disorder of liver, bone marrow, brain,
CC heart, lung, kidney, colon, skeletal muscle, testis, uterus and placenta
CC function. The sequence represents a probe used in the invention to scan
CC the nt 1-1001 portion of human KTOM1a (AB063232)

XX
XX Novel isolated human testis expressed Patched like protein (HTPL), useful
XX for identifying agonist and antagonist and specific binding partners, and
XX for treating subjects having defects in HTPL.
XX
XX Example 2; Page 623; 718pp; English.
XX
XX The present invention relates to human testis expressed patched like
XX protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL
XX has two isoforms, with a few single base pair differences between the
XX two. One of the single base pair changes introduces a premature stop
XX codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL
XX shares an overall structure organisation with the Patched protein. The
XX shared structural features strongly imply that HTPL plays a role similar
XX to that of Patched, and is a potential tumour suppressor. HTPL is
XX important in regulating male germ cell development, and the HTPL gene was
XX mapped to human chromosome 10p12.1. HTPL and its coding sequence are
XX useful for diagnosing a disorder caused by mutation in HTPL, and in
XX therapy and manufacture of a medicament for treatment or prevention of
XX such disorder associated with decreased expression or activity of human
XX HTPL. Such disorders include disorders of testis, or adrenal, adult and
XX foetal liver, bone marrow, brain, kidney, lung, placenta, prostate,
XX skeletal muscle or colon function. HTPL proteins and nucleic acids are
XX clinically useful diagnostic markers and potential therapeutic agents for
XX male infertility and cancer. The present oligonucleotide was used in an
XX example from the invention

XX
XX Novel human SH3 domain (POSH)-like signalling protein 1 polypeptide, POSHL
XX -1, useful for treating disorders associated with decreased expression or
XX activity of human POSHL1.
XX
XX Example 2; SEQ ID NO 1453; 60pp + Sequence Listing; English.
XX
XX The invention relates to an isolated SH3 domain (POSH)-like signalling
XX protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino
XX acids (S1, ABB83999), a sequence having 65% sequence identity to (S1),
XX (S1) having 95% deviations, especially conservative substitutions or a
XX fragment of the sequences comprising at least 8 contiguous amino acids.
XX Human POSHL 1 is a proto-oncogene/oncogene product that functions as an
XX adaptor protein that interacts with Rho family small GTPases as well as
XX downstream components of the signal transduction pathway. (I) is useful
XX for identifying a specific binding partner. (I) and nucleic acids (II)
XX encoded by altered expression of human POSHL1 including diagnosing and
XX caused by altered expression of human POSHL1 including diagnosing and
XX treating cancer, they useful in the development of vaccines and (II) is
XX useful in gene therapy. (II) is useful for constructing microarrays which
XX are useful for measuring and for surveying gene expression and creating
XX transgenic non-human animals capable of producing the proteins. The
XX present sequence is that of a scanning oligonucleotide useful in examples
XX of the invention. Note: The present sequence did not form part of the
XX printed specification, but is based on sequence information supplied to
XX Derwent by the European Patent Office

XX Human leukocyte antigen (HLA) typing, useful for judging HLA genotypes of
PT individuals e.g. by determining immunogenetic differences when
XX transplanting between them.
PS Claim 10; Page 290; 345pp; Japanese.
XX The invention relates to a typing kit for judging human leukocyte antigen
CC (HLA) genotype of a sample by hybridising a substrate on which 10-24 base
CC oligonucleotides (ABL30512-ABL31809) originating in the sequences of
CC genes e.g. belonging to HLA class I antigens on human genome and
CC containing gene polymorphisms as alloantigens have been immobilised as
CC primers for amplification of cleaved nucleic acids relating to gene
CC polymorphisms. The method is useful for judging HLA genotypes of
CC individuals by determining immunogenetic differences before transplanting
CC between them, providing genetic information to decide compatibility of
CC organ and tissue for transplantation e.g. of bone marrow, kidney, liver,
CC pancreas, langerhans islet in pancreas and cornea, susceptibility
CC diagnosis of genetic diseases and identifying individuals

 XX New nucleic acid molecule that modulates replication of West Nile Virus
 PT (MNV), useful for treating a condition related to MNV infection e.g.
 PT pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.
 PT
 PS Claim 23; SEQ ID NO 7339; 495bp; English.
 XX
 XX The invention relates to nucleic acid molecules that modulate replication
 CC of the West Nile Virus (MNV). The nucleic acid molecules are useful for
 CC treating a condition related to MNV infection e.g. pancreatitis,
 CC encephalitis, myocarditis, meningitis, neurologic infection, hepatitis,
 CC liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid
 CC molecule is selected from the group of ribozymes consisting of
 CC Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The
 CC nucleic acid molecules further comprise at least five ribose residues, at
 CC least ten 2'-O-methyl modifications, phosphorothioate linkages on at
 CC least three of the 5' terminal nucleotides and a 3' end modification of a
 CC 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080
 CC are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given
 CC in the specification. The present sequence is that of a nucleic acid
 CC molecule of the invention

PS Disclosure; Page 114; 720pp; French.
XX
XX The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC given in the specification, a sequence containing at least 15 consecutive
CC nucleotides from the 17 mer sequence, a sequence with, after optimal
CC alignment, at least 80 % identity to the 17 mer sequence, or the complement
CC hybridizes to them under highly stringent conditions, or the complement
CC of any of them, or the corresponding RNA. The novel isolated nucleic
CC acids of the invention are useful as probes and primers for detecting,
CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC component of a gene chip, in vitro as (anti)sense reagents, and for
CC production of recombinant polypeptides. Any of the nucleic acids,
CC polypeptides, vectors containing the nucleic acids, cells containing the
CC vector or antibodies directed against the polypeptides are useful for
CC preparation of pharmaceuticals for prevention and/or treatment of viral
CC diseases that are characterized by development of tumours or cell
CC degeneration, specifically cancer but also Alzheimer's disease and
CC schizophrenia. Analysis of the expression and/or prognosis of these
CC patient samples is useful for diagnosis and/or prognosis of these
CC diseases. The polypeptides can also be used to generate antibodies, and
CC both the polypeptide and antibodies are useful as components of protein
CC chips. The nucleic acid sequences of the invention can be used in gene
CC therapy. This polynucleotide sequence represents a tumour suppression
CC related human fukutin oligonucleotide of the invention

XX
XX Novel enzymatic nucleic acid molecules which down regulates expression of
PT a sequence encoding a subunit of nuclear factor kappa B useful for
PT treating cancer, inflammatory disorders and autoimmune diseases.
XX
PS Claim 3; Page 32; 72pp; English.
XX
XX The invention describes an enzymatic nucleic acid molecule (I) which down
CC regulates expression of a sequence encoding a subunit of nuclear factor
CC kappa B (NFkB), where (I) is an inozyme, zinzyme, G-cleaver or amberyzyme
CC configuration. The enzymatic nucleic acid molecule is adapted to treat
CC cancer and is useful for down-regulating RBL-A activity in a cell, for
CC treating a patient having a condition associated with the level of RBL-A.
CC (1) is useful for cleaving RNA comprising a sequence of RBL-A gene, in
CC the presence of a divalent cation, especially Mg²⁺. The enzymatic and
CC antisense nucleic acid molecules are useful for treating breast, lung,
CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,
CC cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or
CC multidrug resistant cancer. The method involves use of other drug
CC therapies such as monoclonal antibodies, RBL-A-specific inhibitors or
CC chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate,
CC cyclophosphamide, doxorubicin, fluorouracil carboplatin, edatrexate,
CC gemcitabine or radiation therapy. The enzymatic and antisense nucleic
CC acid molecules are also useful for treating inflammatory disease such as
CC rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,
CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
CC rejection, gene therapy applications, ischaemia/reperfusion injury
CC (central nervous system (CNS) and myocardial), glomerulonephritis,
CC sepsis, allergic airway inflammation, inflammatory bowel disease or
CC infection. This sequence represents the substrate of a novel enzymatic
CC nucleic acid molecule

PT associated with decreased or increased expression or activity of MD23,
PT MD24, MD27 or MD212, e.g. cancer.
XX
XX
PS Example 8; SEQ ID NO 842; 103pp; English.
XX
XX The present invention relates to novel human zinc finger-containing
CC proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is
CC encoded at chromosome 7q22.1, MD24 is encoded at chromosome 6p21.3-22.2,
CC MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome
CC 15q26.1. The MD23, MD24, MD27, and MD212 sequences are useful in therapy,
CC or in manufacturing a medicament for treating or preventing a disorder
CC associated with decreased or increased expression or activity of MD23,
CC MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic
CC acids and proteins are also useful for diagnosing or monitoring a disease
CC caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic
CC acids can also be used as probes to detect and characterize gross
CC alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are
CC useful in constructing microarrays for measuring gene expression. The
CC proteins are useful as therapeutic agents for gene therapy or as
CC vaccines. The present sequence was used to illustrate the invention.

XX	
CC	The invention relates to the isolation of 6327 nucleotide sequences,
CC	fragments of at least 15 consecutive nucleotides of these nucleotides, a
CC	sequence having at least 80% identity, after optimal alignment, with the
CC	nucleotide, a sequence that hybridizes under stringent conditions with
CC	the nucleotides, or the complement, or corresponding RNA, of the
CC	nucleotides. The nucleotides are used as probes or primers for detecting,
CC	identifying, quantifying and/or amplifying nucleic acids, as in vitro
CC	sense and antisense sequences, of nucleotides involved in tumour
CC	suppression or reversion, apoptosis and or viral resistance, to produce
CC	recombinant polypeptides, and to prepare transgenic animals, as
CC	experimental models. The nucleotides (also vectors containing them and
CC	cells containing the vectors), the encoded polypeptides and antibodies
CC	(Ab) against the polypeptides are useful for prevention and/or treatment
CC	of viral infections or diseases characterized by development of tumours
CC	or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
CC	Analysis of the expression of the nucleotides can be used for diagnosis
CC	and/or prognosis of these diseases. The nucleotides and polypeptides can
CC	also be used to screen for their specific interactive molecules,
CC	potentially useful for treating diseases associated with abnormal
CC	expression of the nucleotides.

```

CC The invention relates to a novel isolated nucleic acid that encodes a
CC protein with a chromatin organisation modifier (CHROMO) domain. The
CC polynucleotide of the invention demonstrates cytostatic activity and may
CC be useful for preparing a composition for treating or preventing a
CC disorder associated with decreased or increased expression or activity of
CC PCCP1 (prostate cancer candidate protein 1), such as a tumour, as well as
CC PCCP1 (prostate cancer candidate protein 1), such as a tumour, as well as
CC during gene therapy and vaccine production procedures. The current
CC sequence is that of the human PCCP1-related DNA fragment SEQ ID 8-
CC directed probe of the invention. Note: The current sequence is not shown
CC within the specification per se but was retrieved from the Wipoweb
CC database.

XX The invention relates to a novel isolated nucleic acid that encodes a
CC protein with a chromatin organisation modifier (CHROMO) domain. The
CC polynucleotide of the invention demonstrates cytostatic activity and may
CC be useful for preparing a composition for treating or preventing a
CC disorder associated with decreased or increased expression or activity of
CC PCCP1 (prostate cancer candidate protein 1), such as a tumour, as well as
CC during gene therapy and vaccine production procedures. The current
CC sequence is that of the human PCCP1-related DNA fragment SEQ ID 8-
CC directed probe of the invention. Note: The current sequence is not shown
CC within the specification per se but was retrieved from the Wipoweb
CC database.

 DR New isolated nucleic acid, useful for treating viral diseases associated
 PT with tumors and cell degeneration, also related polypeptides, antibodies
 PT and transfected cells.
 XX Disclosure; SEQ ID NO 3856; 30pp; French.
 PS This invention relates to novel isolated nucleic acid sequences involved
 CC in the phenomena of tumour suppression, tumour reversion, apoptosis
 CC and/or resistance to viruses. The invention may be useful for the
 CC development of compounds with a cytosolic, vironucle, neuroprotective,
 CC neurotropic or neuroleptic activity. The DNA sequences may be useful as
 CC probes and primers for detecting, identifying, quantifying and/or
 CC amplifying nucleic acid, for example as one component of a gene chip, in
 CC vitro as antisense reagents and for production of recombinant
 CC polypeptides. The invention may therefore be useful for preparation of
 CC pharmaceuticals for prevention and/or treatment of viral diseases that
 CC are characterised by development of tumours or cell degeneration. The
 CC specifically cancer but also Alzheimer's disease and schizophrenia. The
 CC present sequence is that of a nucleic acid sequence of the invention.
 CC Note: The sequence data for this patent did not form part of the printed
 CC specification, but was obtained in electronic format directly from WIPO
 CC at ftp.wipo.int/pub/publshdepct_sequences

Novel enzymatic nucleic acid molecule such as DNazymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.

Disclosure; SEQ ID NO 2345; 122pp; English.

The invention relates to an enzymatic nucleic acid molecule that specifically cleaves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence of a

CC 2'-OH group within the molecule for activity. The nucleic acids are
CC useful for treating hepatitis B virus infection, hepatitis,
CC hepatocellular carcinoma, cirrhosis and liver failure, either alone or in
CC combination with other therapies such as lamivudine and interferons. The
CC nucleic acids are useful as diagnostic tools to examine genetic drift and
CC mutations within diseased cells, for detecting the presence of HBV RNA in
CC a cell, for the study of RNA and for down-regulating gene expression of
CC target genes in bacterial, fungal, viral, plant or mammalian cells. This
CC sequence represents an HBV RNA target sequence, used in the scope of the
CC invention. Note: The sequence data for this patent is also available in
CC electronic format from USPTO at seqdata.uspto.gov/sequence.html.

PT Novel myosin-like protein-1, useful for treating or preventing disorder
PT associated with decreased expression or activity of human genome-derived
PT myosin-like protein-1 such as disorder of heart and/or skeletal muscle
PT function.
XX
PS Disclosure; SEQ ID NO 7674; Opp; English.
XX
CC The invention relates to a novel polypeptide (I) comprising a sequence
CC (S1) of myosin-like protein-1 (hGDMPL-1) having 2568 amino acids fully
CC defined in the specification, a fragment of at least 8 amino acids of
CC (S1), 95% deviation from (S1) which are conservative substitutions, and
CC 65% identity to (S1). A polypeptide of the invention acts as a agonist or
CC antagonist of hGDMPL-1, or as an inhibitor of hGDMPL-1 activity. A
CC pharmaceutical composition of the invention is useful for treating or
CC preventing a disorder associated with decreased expression or activity of
CC hGDMPL-1, such as a disorder of heart and/or skeletal muscle function.
CC The present sequence represents a 17-mer nucleotide, used in the
CC invention for scanning the sequence represented in ACN63103

XX
XX Novel myosin-like protein-1, useful for treating or preventing disorder
PT associated with decreased expression or activity of human genome-derived
PT myosin-like protein-1 such as disorder of heart and/or skeletal muscle
PT function.
XX
PS Disclosure; SEQ ID NO 2756; Opp; English.
XX
CC The invention relates to a novel polypeptide (I) comprising a sequence
CC (S1) of myosin-like protein-1 (hGDMPL-1) having 2568 amino acids fully
CC defined in the specification, a fragment of at least 8 amino acids of
CC (S1), 95% deviation from (S1) which are conservative substitutions, and
CC 65% identity to (S1). A polypeptide of the invention acts as a agonist or
CC antagonist of hGDMPL-1, or as an inhibitor of hGDMPL-1 activity. A
CC pharmaceutical composition of the invention is useful for treating or
CC preventing a disorder associated with decreased expression or activity of
CC hGDMPL-1, such as a disorder of heart and/or skeletal muscle function.
CC The present sequence represents a 17-mer nucleotide, used in the
CC invention for scanning the sequence represented in ACN63102

DR
XX Diagnosing gastric cancer or metastatic gastric cancer comprises
PT measuring the expression levels of RNA or protein of any of the up-
PT and/or down-regulated genes in gastric cancers or metastatic gastric
PT cancer.

XX Example 3; SEQ ID NO 79; 112bp; English.
PS The invention describes a method of diagnosing gastric cancer or
XX metastatic gastric cancer comprising measuring the expression levels of
CC RNA or protein of at least one gene, e.g. up- and/or down-regulated genes
CC in gastric cancers or metastatic gastric cancer. Also described are: a
CC kit, for diagnosing gastric cancer and/or metastatic gastric cancer,
CC comprising: a sense primer and an anti-sense primer of; a probe
CC corresponding to; and an antibody that recognizes the protein encoded by
CC at least one of the cited up- and down-regulated genes; and screening a
CC suppressor of gastric cancer or metastatic gastric cancer. The methods
CC and kits are useful for diagnosing gastric cancer or metastatic gastric
CC cancer. Expression levels for gastric cancer-related marker genes were
CC identified in the 4 pairs of patient samples with gastric cancer.
CC tissues/normal tissues taken from 4 patients with gastric cancer.
CC Competitive RT-PCR was performed to determine the amount of the gene
CC expression of any of the up- and down-regulated genes in gastric cancer.
CC In addition, expression level of any of the up- and down-regulated genes
CC in metastatic gastric cancer was also identified. The amount of
CC competitive RT-PCR products of up- and down-regulated genes in metastatic
CC gastric cancer was higher in most tested metastatic cancer tissues than
CC those of primary cancer tissues. This sequence represents a primer used
CC in competitive PCR to establish which genes are up and/or down regulated
CC in gastric and metastatic cancers.

XX

CC This invention relates to a novel probe set for identifying HLA-C (human
CC leukocyte antigen-C) alleles in a test substance. The invention enables
CC identification of HLA-C alleles in patients with organ transplant,
CC cancer, diabetes and other multiple-factor diseases, and thus provides
CC tailored medical treatment to individual patients. The present sequence
CC is that of an oligonucleotide probe which is used in the HLA-C probe set
CC of the present invention.

XX
CC The invention relates to a novel probe set for the identification of a
CC Human Leukocyte Antigen (HLA)-B allele in a sample. The invention further
CC includes a method for identifying an HLA-B allele using the probe set.
CC The probe set and method are useful for identifying an HLA-B allele in a
CC sample. The information gained is useful, for example, in matching organ
CC donors and recipients, and in guiding clinical decisions in the treatment
CC of diseases such as cancer and diabetes mellitus. This oligo sequence
CC represents a probe used in the identification of a Human Leukocyte
CC Antigen B allele of the invention.

XX New set of genes or gene sequences comprising at least 20 intestinal
PT genes, and at least 5 enzymes, e.g. caspase, apob, aminopeptidase, etc.,
PT useful for determining intestinal health, and/or disease of an animal or
PT a human.

XX Example 1; Page 22; 88pp; English.

XX The invention relates a set of genes or gene sequences comprising at
CC least 20 genes in table 1, and comprising at least 5 of: Na/glucose
CC transporter, K/Cl channel, I-PABP, L-PABP, Cytochrome P450, caspase, beta
CC -2-microglobulin, guanylyl, calbindin, phosphatase, aldolase, actin,
CC metallopeptidase, aminopeptidase, glycosaminotransferase, glutathion S
CC transferase, maltase/glucosaminidase, sucrase/isomaltase, butyrophilin,
CC apob, and cytochrome C oxidase. Also included are detecting the
CC presence/absence of an intestinal disease in an animal/human (comprising
CC measuring, in a sample of the animal or human, expression levels of a set
CC of genes or gene sequences, or a gene specific fragment of the genes and
CC comparing the expression levels with a reference value), measuring an
CC increase of the intestinal health status of an animal/human (comprising
CC measuring in a series of samples of intestinal tissue of the animal taken
CC at different timepoints, expression levels of a set of genes or gene
CC sequences, or a gene specific fragment of the genes and comparing the
CC expression levels with a reference value), a kit comprising a set of at
CC least 2 oligonucleotide primers capable of specifically hybridizing to a
CC set of genes (or a gene specific fragment of the genes) and a kit
CC containing ingredients to measure protein levels of gene products encoded
CC by genes. The set of genes or gene sequences are useful for determining
CC intestinal health, and/or disease of an animal or a human. Expression of
CC genes in 2 chicken strains (susceptible or resistant to Malabsorption
CC syndrome, MAS) was studied using the differential display method. cDNAs
CC differentially expressed genes were amplified and sequenced. cDNAs
CC representing differentially expressed genes were analyzed for their
CC expression levels using the LightCycler RT-PCR method. The present
CC sequence is a PCR primer for a chicken cDNA or chicken virus sequence,
CC used in the LightCycler PCR experiment (Note, these are not RT-PCR
CC primers, the reverse transcription stage is accomplished using random
CC hexamers as primers).

XX Novel isolated human G protein-coupled receptor 3 polynucleotide, useful
PT for therapeutic purposes, for studying the expression and function of the
PT polynucleotide, and for expressing the receptor protein.

XX Claim 16; Page 12; 63pp; English.

XX The invention relates to an isolated human G protein-coupled receptor 3,
CC (GPR3) polynucleotide comprising a sequence which is a polymorphic
CC variant for a reference sequence for the GPR3 gene or its fragment, or a
CC polymorphic variant of a reference sequence for a GPR3 cDNA or its
CC fragment, and the encoded proteins. Also include are method for
CC genotyping/haplotyping an individual by determining the sequence of both
CC copies of the individuals GPR3 genes and examining the sequence at the
CC polymorphic sites included in the specification, identifying an
CC association between a trait and at least one haplotype or haplotype pair
CC of the GPR3 gene involves comparing the frequency of the haplotype or
CC haplotype pair in a population exhibiting the trait with the frequency of
CC the haplotype or haplotype pair in a reference population, where the
CC haplotype is selected from haplotypes 1-5 defined in the specification,
CC where a higher frequency of the haplotype or haplotype pair in the trait
CC population than in the reference population indicates that the trait is
CC associated with the haplotype or haplotype pair. The GPR3 polynucleotide
CC is useful in studying the expression and function of GPR3, and in
CC expressing GPR3 protein for use in screening for candidate drugs to treat
CC diseases related to GPR3 activity. GPR3 is useful for studying expression
CC of the GPR3 isogenes in vivo, for in vivo screening and testing of drugs
CC targeted against GPR3 protein, and for testing the efficacy of
CC therapeutic agents and compounds for disorders related to defects in
CC adenylate cyclase activation, in a biological system. An anti-GPR3
CC antibody is useful for studying the effect of the variation on the
CC biological activity of GPR3 as well as on the binding affinity of the
CC candidate drugs targeting GPR3 for the treatment of disorders related to
CC defects in adenylate cyclase activation. The present sequence is an ASO

CC (allele specific oligonucleotide) PCR primer for detecting GPR3
CC polymorphisms

XX Identifying genetic profile associated with a neurological, psychiatric,
XX or psychological condition, comprises screening individuals for a
XX polymorphism in a genetic locus comprising the dopamine receptor D2
XX (DRD2) gene.
XX
XX Claim 31; SEQ ID NO 1324; 634bp; English.
XX
XX The invention relates to a method of identifying a genetic profile
XX associated with a neurological, psychiatric or psychological condition,
XX phenotype or state including a sub-threshold neurological, psychiatric or
XX psychological condition, phenotype or state in an individual, comprising
XX screening individuals for a polymorphism in a genetic locus comprising
XX the dopamine receptor D2 (DRD2) gene. The invention also relates to a
XX genetic mutation providing a genetic marker for a neurological,
XX psychiatric, or psychological condition, state or phenotype in an
XX individual, where the presence of a 957C polymorphism is indicative of a
XX predisposition to developing a neurological, psychiatric or psychological
XX condition, phenotype or state. The compositions and methods are useful
XX for identifying a genetic profile associated with a neurological,
XX psychiatric or psychological condition. The method enables clinicians to
XX make a genetic or psychological diagnosis of a neurological, psychiatric or
XX psychological condition and can thereby implement treatment or
XX preventative or symptom-alleviating protocols to reduce the adverse
XX consequences of the condition. This sequence represents a human dopamine
XX receptor D2 (DRD2) DNA oligonucleotide used in the scope of the
XX invention.

XX Enzymatic nucleic acid molecules having a hammer-head motif - used for
XX the treatment of arthritis, induction of graft tolerance or treatment of
XX auto-immune diseases.
XX
XX Claim 10; Page 204; 307bp; English.
XX
XX The present invention describes a novel enzymatic nucleic acid (ENA)
XX having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues
XX (iii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least
XX ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's
XX can inhibit collagenase and streptolysin production in the synovial
XX membrane of joints for the treatment or prevention of arthritis,
XX particularly osteoarthritis or rheumatoid arthritis. The ENA's can also
XX be used to treat antigen presenting cells of a donor to induce tolerance
XX in a recipient to an allograft of a donor. They can also be used for
XX enhancing graft tolerance or for treating autoimmune disease, and for
XX treating allergies and other inflammatory conditions. The ENA's can also
XX be used in diagnosis. Ribozyme therapy impacts on the expression of
XX streptolysin without introducing the non-specific effects upon gene
XX expression which accompany treatment with retinoids and dexamethasone.
XX The concentration of ribozyme required to affect a therapeutic treatment

CC is lower than that required of antisense molecules, and is highly
CC specific. The present sequence is used in the exemplification of the
CC present invention

CC be used in diagnosis. Ribozyme therapy impacts on the expression of

CC streptolysin without introducing the non-specific effects upon gene

CC expression which accompany treatment with retinoids and dexamethasone.

CC The concentration of ribozyme required to affect a therapeutic treatment

CC is lower than that required of antisense molecules, and is highly

CC specific. The present sequence is used in the exemplification of the

CC present invention

 XX
 PT New nucleic acid encoding a mutant Omi/HtrA2 protein, useful for
 PT diagnosis of Parkinson's disease and in screening for potential
 PT therapeutic agents.
 XX
 PS Example 1; Fig 5; 7app; German.
 XX
 CS This invention describes a novel polynucleotide that encodes the human
 CC Omi/HtrA2 protein containing the amino acid substitutions S141A and/or
 CC S339G. These changes are associated with development of Parkinson's
 CC disease and the products of the invention can be used for the diagnosis
 CC of Parkinson's disease or a predisposition for it. Omi/HtrA2 is a
 CC mitochondrial serine protease that is implicated in stress-induced
 CC apoptosis and cells that express the mutated Omi/HtrA2 show a reduction
 CC in mitochondrial membrane potential, i.e. damaged mitochondrial function.
 CC To diagnose Parkinson's disease in humans, a test sample is analyzed for
 CC presence of the mutant Omi/HtrA2 polynucleotide, a fragment of Omi/HtrA2
 CC or the encoded protein. The mutant is detected by PCR, using primers
 CC chosen from ABB53621-ABB53637 and amplicons are analyzed by denaturing
 CC HPLC, heteroduplex methods or direct sequencing. The presence of
 CC amplicons is detected by hybridization with a probe chosen from ABB53638-
 CC ABB53641. The PCR primers and probes of the invention can be incorporated
 CC into a kit for detecting Parkinson's disease or a predisposition to it.
 CC The exon 1 mutation (i.e. S141A) was found in 25 of 414 patients with
 CC Parkinson's disease and the exon 7 mutation (i.e. S339G) was found in 4
 CC of 514 patients. Where the mutations were detected, they were always
 CC heterozygous. The variant proteins described in the invention are used to
 CC screen for specific binding agents useful for treating Parkinson's
 CC disease. This sequence represents a fragment of human Omi/HtrA2 exon 7
 CC which encodes the S339G mutation.

 PT Probe set for specific identification of an HLA-B allele in a sample,
 PT useful e.g. in matching transplant donors and recipients, and in
 PT determining suitable treatment for patients with conditions such as
 PT cancer and diabetes mellitus.
 XX
 PS Claim 2; SEQ ID NO 167; 152pp; Japanese.
 XX
 CS The invention relates to a novel probe set for the identification of a
 CC Human Leukocyte Antigen (HLA)-B allele in a sample. The invention further
 CC includes a method for identifying an HLA-B allele using the probe set.
 CC The probe set and method are useful for identifying an HLA-B allele in a
 CC sample. The information gained is useful, for example, in matching organ
 CC donors and recipients, and in guiding clinical decisions in the treatment
 CC of diseases such as cancer and diabetes mellitus. This oligo sequence
 CC represents a probe used in the identification of a Human Leukocyte
 CC Antigen B allele of the invention.

XX
XX Kit for automated genotyping contg. pairs of PCR primers - designed to
PT amplify polymorphic nucleotide repeat sequences, arranged in sets each
PT with a characteristic fluorescence label, useful e.g. in detection of
PT disease related genetic rearrangement.
XX
XX Disclosure; Fig 7G-2; 104pp; English.
XX
XX The method aims to provide a collection of highly reproducible
CC microsatellite marker sequences (MMS) at approx. 10-50 cM intervals
CC throughout the human genome which can be detectably labelled. The MMS are
CC polymorphic, simple sequence repeats and can be used in automated
CC genotyping. esp. fluorescence-based. The primers correspond to the unique
CC DNA sequence surrounding each marker, and PCR is used to detect each
CC polymorphism. When the MMS show considerable polymorphism (ie. a
CC difference in the number of repeats) between individuals, the markers can
CC be particularly informative. The MMS can be ideal for linkage studies.
CC Kits comprise at least 4 groups, of at least 3 sets, each comprising
CC labelled primers for PCR amplification of the DNA. Group 7 primer pairs
CC are shown in AAg95687-734. The published size range of the D18S66 allele
CC is 244-262 bp, and the degree of heterozygosity in the population is
CC about 86%

XX PT Analyzing a marker nucleic acid region of a clonal population of cells
XX PT that is flanked on one or both sides by members of distinct repeated
XX PT sequences by identifying nucleic acid sequence regions flanking the
XX PT marker nucleic acid region.
XX
XX PS Example 3; SEQ ID NO 225; 99pp; English.
XX
XX CC The invention relates to a method of analyzing a marker nucleic acid
XX CC region of a clonal population of cells that is flanked on one or both
XX CC sides by members of a family of distinct repeated sequences comprises
XX CC identifying one or more of the nucleic acid sequence regions flanking the
XX CC marker nucleic acid region. The method is useful in diagnosing and/or
XX CC monitoring a mammalian disease condition, the condition is a neoplastic
XX CC condition, e.g. malignant or non-malignant neoplastic condition. The
XX CC condition is an immunodeficiency and the screening is directed to
XX CC detecting specific immune cell expansion. The condition is an immune
XX CC response and the screening is directed to detecting specific immune cell
XX CC expansion. The method is useful for analyzing a marker nucleic acid
XX CC region of a clonal population of cells that is flanked on one or both
XX CC sides by members of distinct repeated sequences. The present sequence
XX CC represents a V segment TCR beta primer.

 PT Molecular design by exon shuffling within a library of DNA sequences.
 PT
 PS Example 2; Page 15; 42pp; Japanese.
 XX
 XX This sequence represents a thrombin inhibitor that was used in an example
 CC of the process of the invention. The process is for molecular design, and
 CC is carried out by shuffling exons within a library of similar DNA
 CC sequences, followed by ranking of the products of reshuffling by their
 CC fit to the desired functionality, and repeating the shuffling and ranking
 CC until a product of the desired functionality is obtained. A similar
 CC process may be carried out using polypeptide sequences. The technique can
 CC be used for the improvement of function, and devising of new functions,
 CC of polypeptides and nucleic acids, for a broad range of uses such as
 CC drugs and foodstuffs. Evolution of high functional fit is rapid compared
 CC to the use of conventional genetic evolution algorithms

XX Novel genetic variants of selectin L lymphocyte adhesion molecule 1
PT (SELL) gene useful for therapeutic purposes and for expressing SELL
PT protein useful in identifying drugs to treat whooping cough.
XX
XX
XX Claim 17; Page 14; 137pp; English.

The invention relates to an isolated polynucleotide (I) comprising a nucleotide sequence which is a polymorphic variant of a reference sequence for Selectin L Lymphocyte Adhesion Molecule 1 (SELL) gene. SELL polypeptide is useful for screening for drugs targeting the polypeptide. Oligonucleotides derived from (I) are used to target SELL and a haplotype or haplotype pair of SELL gene. These are useful in developing diagnostic tests and therapeutic treatments for neonatal pertussis (whooping cough). (1) is useful for studying the expression and function of SELL and expressing SELL protein for use in screening for candidate drugs to treat diseases related to SELL activity. The polymorphism and haplotype data are useful for validating whether SELL is a suitable target for drugs to treat whooping cough, screening for such drugs and reducing bias in clinical trials of such drugs. Establishing the SELL haplotype or haplotype pair of an individual is useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with SELL activity e.g. neonatal pertussis (whooping cough). The haplotyping method is useful to validate SELL as a candidate target for treating a specific condition or disease predicted to be associated with SELL activity. The method is also useful in screening for compounds targeting SELL to treat a specific condition or disease predicted to be associated with SELL activity, e.g. detecting which of the SELL haplotypes or haplotype pairs present in individual members of a population with the specific disease of interest enables one to screen for compounds that display the highest desired agonist or antagonist activity for each of the most frequent SELL isoforms present in the disease population. A polymorphic variant of SELL is useful in studying the effect of the variation on the biological activity of SELL, on the binding affinity of candidate drugs targeting SELL for the

CC treatment of neonatal pertussis (whooping cough) and in assays to measure
CC the binding affinities of one or more candidate drugs targeting the SELL
CC protein. ABRK5465-ABRK5559 represent SELL gene allele-specific

XX Novel genetic variants of Solute Carrier Family 1 (Glutamate/Neutral
PT Amino Acid Transporter), Member 4 isoforms, for improving efficiency and
PT reliability in drug development for treating cancers.
XX
XX
XX Claim 15; Page 16; 139pp; English.

The invention relates to an isolated polynucleotide (I) comprising a first nucleotide sequence which comprises solute carrier family 1 (glutamate/neutral amino acid transporter), member 4 (SLC1A4) isoforms (II) and an isolated polypeptide (III) comprising an amino acid sequence which is a polymorphic variant of a reference sequence for SLC1A4 protein. Also described are methods for: (1) haplotyping or genotyping SLC1A4 gene of an individual; (2) predicting a haplotype pair for SLC1A4 gene of an individual; (3) identifying an association between a trait and at least one haplotype or haplotype pair of SLC1A4 gene. (III) is useful in screening for drugs targeting (III) that are useful for treating cancer, neurological diseases and amino acid transporter disorders. The methods are useful for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with SLC1A4 activity. The haplotyping method is also used by the pharmaceutical research scientist to validate SLC1A4 as a candidate target for treating a specific condition or disease predicted to be associated with SLC1A4 activity, e.g. cancer, neurological diseases and amino acid transporter disorders, and in the design of clinical trials for treating a specific condition of disease associated with SLC1A4 activity. The methods are also useful for screening compounds targeting SLC1A4. Anti-SLC1A4 antibody is useful in diagnostic.

XX Novel genetic variants of Solute Carrier Family 1 (Glutamate/Neutral
 PT Amino Acid Transporter), Member 4 isogenes, for improving efficiency and
 PT reliability in drug development for treating cancers.

PS Claim 15; Page 15; 139pp; English.

XX The invention relates to an isolated polynucleotide (I) comprising a
 CC first nucleotide sequence which comprises solute carrier family 1
 CC (glutamate/neutral amino acid transporter), member 4 (SLC1A4) isogenes
 CC (II) and an isolated polypeptide (III) comprising an amino acid sequence
 CC which is a polymorphic variant of a reference sequence for SLC1A4
 CC protein. Also described are methods for: (1) haplotyping or genotyping
 CC SLC1A4 gene of an individual; (2) predicting a haplotype pair for SLC1A4
 CC gene of an individual; (3) identifying an association between a trait and
 CC at least one haplotype or haplotype pair of SLC1A4 gene. (III) is useful
 CC in screening for drugs targeting (III) that are useful for treating
 CC cancer, neurological diseases and amino acid transporter disorders. The
 CC methods are useful for improving the efficiency and reliability of
 CC several steps in the discovery and development of drugs for treating
 CC diseases associated with SLC1A4 activity. The haplotyping method is also
 CC used by the pharmaceutical research scientist to validate SLC1A4 as a
 CC candidate target for treating a specific condition or disease predicted
 CC to be associated with SLC1A4 activity, e.g. cancer, neurological diseases
 CC and amino acid transporter disorders, and in the design of clinical
 CC trials for treating a specific condition of disease associated with
 CC SLC1A4 activity. The methods are also useful for screening compounds
 CC targeting SLC1A4. Anti-SLC1A4 antibody is useful in diagnostic.

CC prognostic and therapeutic methods. ABK95761-ABK95877 represent SLC1A4
 CC gene allele-specific oligonucleotides, primer extension oligonucleotides
 CC and related PCR primers used to identify single nucleotide polymorphisms
 CC (SNP) of the gene

XX Isolated human pyridoxal (pyridoxine, vitamin B6) kinase polynTs, useful
 PT for therapeutic purposes, for studying the expression and function of the
 PT polynT, and for expressing pyridoxal protein.

PS Claim 17; Page 13; 135pp; English.

XX The invention describes an isolated human pyridoxal (pyridoxine, vitamin
 CC B6) kinase, (PDXK) polynucleotide. The polynucleotide is useful in
 CC studying the expression and function of PDXK, and in expressing PDXK
 CC protein for use in screening for candidate drugs to treat PDXK related
 CC diseases and for therapeutic purposes. A transgenic animal is useful for
 CC studying expression of the PDXK isogenes in vivo, for in vivo screening the
 CC efficacy of therapeutic agents and compounds for autoimmune polyglandular
 CC disease type 1. The polypeptide is useful for studying the effect of the
 CC variation on the biological activity of PDXK and the binding affinity of the
 CC candidate drugs targeting PDXK for the treatment of autoimmune
 CC polyglandular disease type 1. Genotyping and haplotyping is useful for
 CC improving the efficacy and reliability of several steps in the discovery
 CC and development of drugs for treating diseases associated with PDXK
 CC activity, e.g., autoimmune polyglandular disease type 1, to validate PDXK
 CC as a candidate agent for treating a specific condition or disease
 CC predicted to be associated with PDXK activity, and in the design of
 CC clinical trials of candidate drugs. This sequence is one of 20 (see
 CC ABK16921-ABK16940) allele specific oligonucleotide (ASO) probe used for
 CC detecting PDXK gene polymorphisms, described in the method of the
 CC invention

XX	drugs to treat diseases e.g. cataract.
PS	
XX	Claim 15; Page 12; 94p; English.
CC	
CC	The invention relates to an isolated polynucleotide comprising a sequence
CC	which is a polymorphic variant of a reference sequence for crystallin,
CC	beta B1 (CRYBB1, located on chromosome 22q12.1) gene or their fragment,
CC	where the polymorphic variant comprises a CRYBB1 isogene defined by a
CC	haplotype from haplotypes 1-16 as given in the specification. Also
CC	included are a transgenic non-human animal transformed or transfected
CC	with the polymorphic variant, a computer system for storing and analysing
CC	polymorphism data for CRYBB1 gene, a genome anthology for the CRYBB1 gene
CC	which comprises the defined CRYBB1 isogenes, methods of determining the
CC	individuals haplotype or genotype with a disease or trait and a
CC	association of a particular haplotype with a disease or trait and a
CC	composition comprising at least one genotyping oligonucleotide
CC	(especially allele-specific oligonucleotides (ASO)) for detecting a
CC	polymorphism in the CRYBB1. The isogenes or haplotypes are useful for
CC	improving the efficiency and reliability of several steps in the
CC	discovery and development of drugs for treating diseases associated with
CC	CRYBB1 activity, e.g. cataract. and can also be used by the
CC	pharmaceutical research scientist to validate CRYBB1 as a candidate
CC	target for, and in design of clinical trials of candidate drugs for,
CC	treating a specific condition drugs or disease predicted to be associated
CC	with CRYBB1 activity. The ASOs are useful as probes and primers, and for
CC	assaying a polymorphism in the target region. The present sequence is an
CC	ASO PCR primer for CRYBB1

PT Novel caspase 5 apoptosis-related cysteine protease, useful

PT therapeutically and in screening for drugs targeting protease
PT polypeptide.
XX
XX Claim 14; Page 15; 115pp; English.
XX
XX The invention relates to single nucleotide polymorphisms in the gene
CC encoding the human caspase 5, apoptosis-related cysteine protease (CASP5)
CC polypeptide. A method for haplotyping the CASP5 gene in an individual
CC comprises identifying the nucleotide at one or more polymorphic sites and
CC determining whether one of the copies of the gene is defined by one of
CC the CASP5 haplotypes given in the specification or whether both copies
CC are defined by a haplotype pair. This method is useful in genotyping,
CC whereby all possible haplotype pairs can be assigned to specific
CC genotypes. An association between a trait and a haplotype or haplotype
CC pair of the CASP5 gene can be identified by comparing the frequency of
CC the haplotype or haplotype pair in a population exhibiting the trait with
CC the frequency of the haplotype or haplotype pair in a reference
CC population, where a higher haplotype frequency in the trait population
CC indicates the trait is associated with the haplotype or haplotype pair.
CC CASP5 and its corresponding DNA are used for studying the expression and
CC function of CASP5, for use in screening for candidate drugs to treat
CC diseases related to CASP5 activity, such as cancer (e.g. hereditary
CC nonpolypoid colorectal cancer, gastrointestinal tumours and endometrial
CC tumours). Sequences ABA81480-ABA81519 represent allele-specific
CC oligonucleotide sequencing primers used to detect CASP5 gene
CC polymorphisms

XX Claim 16; Page 13; 61pp; English.
PS
XX
CC The present sequence is that of an allele-specific primer used to assay a
CC polymorphism in the human chemokine (C-C motif) receptor 5 (CCR5) gene of
CC the invention. The specification describes haplotyping the CCR5 gene of
CC an individual by determining if the individual has one of the CCR5
CC haplotypes or haplotype pairs fully defined in the specification. The
CC specification also describes an isolated polynucleotide comprising a
CC nucleotide sequence which is a polymorphic variant of the reference CCR5
CC gene sequence (see AB497318) and comprises an isogene defined by a
CC haplotype described in the specification and its encoded polypeptide. The
CC methods of the invention are useful to diagnose and develop treatment for
CC diseases associated with abnormal expression or function of the gene. The
CC CCR5 isogenes and the screened compounds are useful for treating human
CC immunodeficiency virus (HIV)-1 infection and the progression to acquired
CC immunodeficiency syndrome (AIDS). The invention has antiviral
CC applications. The specification describes genotyping the CCR5 gene of an
CC individual; predicting a haplotype pair for the CCR5 gene of an
CC individual; identifying an association between a trait and a haplotype or
CC haplotype pair of the CCR5 gene. The specification describes a
CC composition comprising a genotyping oligonucleotide for detecting a CCR5
CC polymorphism; a recombinant non-human organism transformed with CCR5
CC polynucleotide expressing a CCR5 protein encoded by the variant sequence;
CC an isolated antibody specific for the CCR5 polypeptide and a method for
CC screening drugs targeting the CCR5 polypeptide

PT Novel genetic variants of acid phosphatase 2, lysosomal polypeptide gene
PT useful in studying expression and function of the protein, and for

PT screening drugs to treat diseases e.g. Hodgkin's disease.
XX
PS Claim 17; Page 14; 109pp; English.
XX
XX The invention comprises the human lysosomal acid phosphatase 2 (ACP2)
CC nucleic acid and protein sequences. Specifically, the invention relates
CC to the discovery of 22 novel polymorphic sites within the ACP2 gene. The
CC invention also comprises methods for haplotyping and genotyping the ACP2
CC gene in an individual. The ACP2 gene (located on chromosome 11) encodes a
CC lysosomal-specific enzyme that catalyzes the hydrolysis of
CC orthophosphoric monoesters to alcohol and phosphate. The ACP2 gene and
CC protein are pharmaceutically important in the treatment of Hodgkin's
CC disease (HD) and acid phosphatase deficiency. The novel ACP2 gene
CC polymorphisms of the invention are useful in haplotyping the ACP2 gene.
CC ACP2 haplotyping is useful in validating ACP2 as a target (and designing
CC drugs) for treating an ACP2-related disease or condition (e.g. Hodgkin's
CC disease and acid phosphatase deficiency). The ACP2 gene polymorphisms are
CC useful for ACP2 genotyping, which can also be used to develop diagnostic
CC tests and therapeutic treatments. The ACP2 protein and nucleic acids of
CC the invention are useful in the production of a transgenic animal which
CC expresses ACP2 protein. The ACP2 nucleic acids of the invention are
CC useful in the production of allele-specific oligonucleotides designed to
CC genotype each of the ACP2 polymorphisms. Nucleic acids AB136299-AB136320
CC represent claimed ACP2 allele-specific probes. Nucleic acids AB136321-
CC AB136364 represent claimed ACP2 allele-specific PCR primers. Nucleic
CC acids AB136365-AB136408 represent claimed ACP2 primer-extension
CC oligonucleotides

PT New genetic variants of smoothened Drosophila homolog (SMOH) gene useful
PT for therapeutic purposes and for expressing SMOH protein useful in
PT identifying drugs to treat basal cell carcinomas.
XX

PS Claim 15; Page 15; 179pp; English.
XX
CC The invention relates to an isolated polynucleotide comprising a sequence
CC which is a polymorphic variant of a reference sequence for the human
CC smoothened Drosophila homologue (SMOH) gene or its fragment, or a
CC polymorphic variant of a reference sequence for a SMOH cDNA or its
CC fragment. A new isolated polypeptide is useful for screening for drugs
CC targeting the polypeptide. A new method is useful for identifying an
CC association between a trait such as a clinical response to a drug
CC targeting SMOH and a haplotype or haplotype pair of SMOH gene. The
CC methods have applicability in developing diagnostic tests and therapeutic
CC treatments for basal cell carcinomas (BCCs). The isolated polynucleotide
CC is useful for studying the expression and function of SMOH and expressing
CC SMOH protein for use in screening for candidate drugs to treat diseases
CC related to SMOH activity. The polymorphism and haplotype data are useful
CC for validating whether SMOH is a suitable target for drugs to treat BCCs,
CC screening for the drugs and reducing bias in clinical trials of the
CC drugs. The isolated polynucleotide is useful for therapeutic purposes.
CC The new method, an oligonucleotide and kit of the invention are useful
CC for determining whether an individual has one of the haplotypes or the
CC haplotype pairs. The polynucleotides of the invention can be used to
CC treat disorders by gene therapy and antisense gene therapy. This
CC polynucleotide sequence represents a primer used for detecting human
CC smoothened Drosophila homologue gene polymorphisms of the invention

PT hypercholesterolemia.
XX
PS Disclosure; SEQ ID NO 5; 72pp; English.

XX
CC This invention relates to novel genetic markers and variants of the gene
CC encoding the cholesterol ester transfer protein (CERP) located on
CC chromosome 16q13. Specifically, it refers to a set of haplotypes in the
CC CERP gene that are associated with statin-specific variation in high
CC density lipoprotein cholesterol (HDL) response. The present invention
CC describes a kit for determining whether an individual has a statin
CC response marker I or II, which comprises a set of oligonucleotides
CC designed for identifying at least one of the alleles at each of the
CC polymorphic sites of CERP. Accordingly, the method of the invention can
CC be used in preparing a composition for diagnosing or treating
CC cardiovascular disease caused by elevated LDL or HDLC, and more
CC particularly for the treatment of dyslipidaemia, hyperlipidaemia or
CC hypercholesterolaemia. This oligonucleotide sequence is a human allele-
CC specific oligo (ASO) probe used for detecting the CERP haplotypes of the

XX
XX A kit comprising a set of oligonucleotides designed for identifying at
CC least one of the alleles at each polymorphic site (PS) in a set of 129
CC polymorphic sites (PSs) given in the specification, is new. The kit
CC identifies at least one of the alleles at each polymorphic site (PS) in a
CC set of 129 polymorphic sites (PSs) given in the specification, for
CC example: PS1 and PS42; PS19 and PS42; PS3, PS12, and PS42; a set of
CC polymorphic sites comprising a linked haplotype to any one of haplotypes
CC 101-194, 201-463 or 501-515 given in the specification; or a set of

polymorphic sites comprising a substitute haplotype for any one of haplotypes 101-194, 201-463 or haplotypes 501-515 given in the specification; where the nucleotide position of each polymorphic site corresponds to the following nucleotide position in the 32577-bp sequence: 1118 (PS1), 1773 (PS3), 1875 (PS4), 1911 (PS5), 1957 (PS6), 2087 (PS10), 2157 (PS12), 13384 (PS15), 13405 (PS16), 16200 (PS19), 17194 (PS20), 17273 (PS21), 20035 (PS26), 20047 (PS28), 20615 (PS30), 21944 (PS33), 22155 (PS35), 25705 (PS37), 25921 (PS38), 27882 (PS39), and 30618 (PS42). INDEPENDENT CLAIMS are also included for: determining whether an individual has a statin response marker I or a statin response marker II; selecting a statin therapy to provide an optimal High Density Lipoprotein Cholesterol (HDL) response in an individual; predicting an individual's High Density Lipoprotein Cholesterol (HDL) response to treatment with a statin; predicting an individual's High Density Lipoprotein Cholesterol (HDL) response to treatment with a statin; manufacturing a drug product; seeking regulatory approval for marketing a pharmaceutical formulation for treating a disease or condition in a population partially or wholly defined by having a statin response marker I; marketing a drug product comprising a statin as at least one active ingredient for treating a disease or condition in a population partially or wholly defined by having a statin response marker I; an isolated polynucleotide comprising a first nucleotide sequence which comprises the integrin, beta 3 (ITGB3) isogene encoding a ITGB3 polypeptide, where the integrin isogene consisting of isogenes 1-38 and 40-98 defined by a correspondingly numbered 1000-2235, haplotype, where each of the isogenes comprises nucleotides 1000-2235, 4256-4716, 1317913723, 14235-14858, 16126-16619, 16930-17414, 19241-19644, 19748-20177, 2053721009, 21731-22412, 24385-24930, 25559-26029, 27822-28255, 30265-30754, and 31300-31718 of the 32577-bp sequence, 27822-28255, 30265-30754, and 31300-31718 of the 32577-bp sequence, except where substituted by the sequence of alleles for the except where substituted by the sequence of alleles for the except where substituted by the sequence of alleles for the polymorphic sites whose nucleotide positions in the 32577-bp sequence and a second nucleotide sequence which is complementary to the first nucleotide sequence; a recombinant nonhuman organism transformed or transfected with the isolated polynucleotide, where the organism expresses an ITGB3 polypeptide encoded by the selected ITGB3 isogene; an isolated fragment of an integrin, beta 3 (ITGB3) isogene, where the fragment comprises one or more polymorphisms consisting of thymine at PS 1, guanine at PS2, cytosine at PS3, thymine at PS4, cytosine at PS5, adenine at PS6, thymine at PS7, thymine at PS8, guanine at PS9, adenine at PS10, adenine at PS11, thymine at PS12, adenine at PS13, guanine at PS 16, adenine at PS 18, thymine at PS 19, guanine at PS21, guanine at PS22, cytosine at PS23, thymine at PS24, thymine at PS25, adenine at PS26, adenine at PS27, cytosine at PS29, adenine at PS30, cytosine at PS31, guanine at PS32, adenine at PS33, adenine at PS35, cytosine at PS37, thymine at PS38, cytosine at PS39, adenine at PS40, thymine at PS41, thymine at PS42, guanine at PS43 and guanine at PS44; a genome anthology for the integrin, beta 3 (ITGB3) gene which comprises two or more ITGB3 isogenes consisting of isogenes 1-98, where each of the selected isogenes is defined by a correspondingly numbered haplotype given in the specification, and where each of the isogenes comprises nucleotides 1000-2235, 4256-4716, 13179-13723, 14235-14858, 16126-16619, 16930-17414, 19241-19644, 19748-20177, 2053721009, 21731-22412, 24385-24930, 2555926029, 27822-28255, 30265-30754, and 31300-31718 of the 32577-bp sequence except where substituted by the sequence of alleles for the correspondingly numbered haplotype at each of the polymorphic sites; haplotyping the integrin, beta 3 (ITGB3) gene of an individual; assigning a haplotype pair for the integrin, beta 3 (ITGB3) gene to an individual; reducing the potential for bias in a clinical trial of a candidate drug for treating a disease or condition predicted to be associated with ITGB3 activity; an isolated polypeptide comprising a ITGB3 protein variant consisting of protein variants A, B, C, D, E, F and G and comprising 788-amino acid sequence, except where substituted by the corresponding sequence of amino acids whose positions and alleles are given in the specification; with the selected ITGB3 protein antibody specific for and immunoreactive with the selected ITGB3 protein variant comprising the isolated polypeptide; screening for drugs targeting the selected ITGB3 protein variant comprising the isolated polypeptide; an isolated fragment of an ITGB3 protein variant, where the fragment is at least 6 amino acids in length and comprises one or more variant amino acids consisting of methionine at a position corresponding to amino acid position 66, methionine at a position corresponding to amino acid position 445, and glutamine at a position corresponding to amino acid position 515 the 788-amino acid sequence; screening for drugs targeting

the selected ITGB3 protein variant comprising the isolated polypeptide; screening for compounds targeting the ITGB3 protein to treat a condition or disease predicted to be associated with ITGB3 activity; validating the ITGB3 protein as a candidate target for treating a medical condition predicted to be associated with ITGB3 activity; and an isolated oligonucleotide designed for detecting a polymorphism in the integrin, beta 3 (ITGB3) gene at a polymorphic site (PS) consisting of PS1-PS44, where the oligonucleotide contains or is located one to several nucleotides downstream of the selected PS, where the oligonucleotide has a length of about 15 to about 100 nucleotides. Preferred Kit: The kit further comprises a manual with instructions for performing one or more reactions on a human nucleic acid sample to identify the allele(s) present in the individual at each polymorphic site in the set of polymorphic sites and determining if the individual has a statin response marker I or a statin response marker II based on the identified allele(s). The set of oligonucleotides is designated for identifying both alleles at each polymorphic site of the selected set of polymorphic sites. The set of PSs comprises PS3, PS12 and PS42; PS 1, PS12 and PS42; PS3 and PS42; PS1 and PS42; PS1, PS3, PS12 and PS42; or PS39. The set of PS 18 PS3, PS12 or PS42. The individual is Caucasian. The linkage disequilibrium between the linked haplotype and any one of haplotypes 101-194, 201-463 or 501-515 has $r^2 \geq 0.2$ consisting of at least 0.75, at least 0.80, at least 0.85, at least 0.90, at least 0.95 or 1.0. At least one of the oligonucleotides in the set of oligonucleotides is an allele-specific oligonucleotide comprising a nucleotide sequence consisting of 10-15 bp. The set of polymorphic sites is PS3, PS12, and PS42 and the set of oligonucleotides comprises first, second and third allele-specific oligonucleotide (ASO) probes, where the first ASO probe comprises 15-bp sequence, or its complement, and S in the 15-bp sequence is guanine; the second ASO probe comprises 15-bp sequence, or its complement, and Y in the 15-bp sequence is cytosine; the third ASO probe comprises 15 bp, or its complement, and Y in the 15-bp sequence is cytosine. Preferred Article: The article of manufacture comprises a pharmaceutical formulation and at least one indicium identifying a population for whom the pharmaceutical formulation is indicated, where the pharmaceutical formulation comprises a statin as at least one active ingredient and the identified population is partially or wholly defined by having a statin response marker I, where a trial population to the pharmaceutical marker I exhibits a better HDLC response to the pharmaceutical formulation than to treatment with atorvastatin or a salt of atorvastatin acid. It also comprises packaging material, where the formulation contained within the packaging material, where the pharmaceutical formulation comprises a statin as at least one separate active ingredient, and the packaging material formulation is indicated for a which states that the pharmaceutical formulation is indicated for a population partly or wholly defined by having a statin response marker I, where a trial population having the statin response marker exhibits a better HDLC response to the pharmaceutical formulation than to treatment with atorvastatin or a salt of atorvastatin acid. Preferred Oligonucleotide: The isolated oligonucleotide is an allele-specific oligonucleotide that specifically hybridizes to an allele of the ITGB3 gene at a region containing the polymorphic site. The isolated oligonucleotide is a primer-extension oligonucleotide. The kit is for haplotyping the integrin, beta 3 (ITGB3) gene of all individual, comprises a set of oligonucleotides designed for identifying at least one of the alleles at each polymorphic site (PS) in a set of two or more polymorphic sites. Preferred Method: Determining whether an individual has a statin response marker I or a statin response marker II comprises determining the copy number in the individual of the haplotype, where if the selected haplotype is one of haplotypes given in the specification, then the individual has a statin response marker I if the individual has at least one copy of the selected haplotype and a statin response marker II if the individual has zero copy of the selected haplotype; and the individual has a statin response marker I if the individual has zero or one copy of the selected haplotype and a statin response marker II if the individual has two copies of the selected haplotype. The individual is a candidate for treatment with a statin. The determining step comprises genotyping each polymorphic site in a set of polymorphic sites comprising the selected haplotype and using the results of the genotyping step to identify, for the set of polymorphic sites the haplotype pair present in the individual. The determining step comprises consulting a data repository that provides information on the copy number present in the individual for the selected haplotype. The data repository is the

CC individual's medical records or a medical data card. Assigning an
CC individual to a first or second statin response marker group comprises
CC determining the copy number in the individual or a haplotype and
CC assigning the individual to the first statin response marker group if the
CC individual has at least one copy of the selected haplotype and to the
CC second statin response marker group if the individual has zero copy of
CC the selected haplotype; and assigning the individual to the first statin
CC response marker group if the individual has zero or one copy of the
CC selected haplotype and to the second statin response marker group if the
CC individual has two copies of the selected haplotype. The determining step
CC comprises genotyping each polymorphic site in a set of polymorphic sites

XX Producing a repertoire of random peptides on the surface of adeno-
PT associated virus (AAV) particles, useful for gene therapy, comprises
PT expressing in a recombinant host cell nucleic acids encoding a diverse
PT population of peptides.

XX Example 1; Page 18; 36pp; English.

XX The specification describes a method for producing a repertoire of random
CC peptides on the surface of adeno-associated virus (AAV) particles. The
CC method comprises expressing in a recombinant host cell nucleic acids
CC encoding a diverse population of peptides, where each peptide is
CC expressed as a fusion with an AAV capsid protein of an AAV particle which
CC displays at its surface the diverse population of peptides, and the AAV
CC particle have the ability to replicate provided by genetic information
CC packaged with it and a helper vector providing the adenovirus helper
CC functions. The capsid protein is VP1, VP2, or VP3 protein. The method is
CC useful for producing a repertoire of random peptides on the surface of
CC AAV particles. The method is useful in gene therapy, where the AAV
CC vectors obtained are useful for treating diseases associated with a
CC dysfunction of human coronary artery endothelial cells, e.g. coronary
CC heart disease or cardiovascular diseases. They are also useful for

CC treating infectious diseases. The present primer was used for second
CC strand synthesis of an oligonucleotide that encodes a random 7 residue
CC peptide insert at position 3967 in the AAV genome. It was used to
CC generate random peptide libraries in the plasmid level.

XX Use of tachykinin antagonist or agonist for treating diseases mediated by
PT binding of tachykinin ligand to its platelet associated receptor and
PT failure of platelet having tachykinin receptor to aggregate normally in
PT presence of tachykinin.

XX Disclosure; Page 21; 46pp; English.

XX The invention relates to the use of a tachykinin antagonist in the
CC manufacture of a medicament for treating e.g. a disease mediated by
CC binding of a tachykinin ligand to its platelet associated receptor. A
CC method of identifying an antagonist or agonist of tachykinin having a
CC platelet associated tachykinin receptor involves contacting a compound to
CC be evaluated with platelets expressing the tachykinin receptor in the
CC presence of the tachykinin and monitoring for an increase or decrease of
CC platelet aggregation. The agonist is useful in the manufacture of a
CC medicament in bulk quantities for treating a disease or conditions
CC mediated by binding of a tachykinin ligand to its platelet-associated
CC receptor (e.g. thrombosis), and by a failure of or a reduced ability of
CC platelet having a tachykinin receptor to aggregate normally in the
CC presence of the tachykinin; antagonizing or stimulating the effect of
CC tachykinin on platelet associated tachykinin receptor; and stimulating
CC platelet aggregation (e.g. wound healing). Sequences ADN12182-ADN12193
CC represent PCR primers for amplifying tachykinin receptors NK1, NK2 and
CC NK3.

 PT Treatment of airway diseases such as asthma - by topically applying
 PT adenosine-free antisense oligo:nucleotide to airway epithelium of
 PT subject.
 XX
 PS Example 5; Page 42; 71pp; English.
 XX
 CC A method for treating airway disease in a subject has been produced.
 CC which involves the topical administration of an essentially adenosine
 CC free antisense oligonucleotide (ON) to the airway epithelium of the
 CC subject. The present sequence is an antisense oligonucleotide specific
 CC for endothelial nitric oxide. The method can be used to treat airway
 CC diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary
 CC disease, bronchitis and other airway diseases characterised by an
 CC inflammatory response. By eliminating adenosine from the antisense ON,
 CC its liberation upon antisense degradation is prevented, thereby
 CC preventing adenosine-induced bronchoconstriction in patients with hyper-
 CC reactive airways

 PT Detection and characterisation of nucleic acid sequences - by mixing a
 PT folded target and one or more probes to form a probe/folded target
 PT complex and detecting and characterising the complexes.
 XX
 PS Example 8; Page 129; 279pp; English.
 XX
 CC The invention relates to methods and compositions of detection and
 CC characterisation of nucleic acid sequences and sequence changes. One
 CC method of detection and characterisation comprises: (a) providing: (i) a
 CC folded target having a DNA sequence comprising at least 1 double stranded
 CC region and at least 1 single stranded region; and (ii) at least 1 probe
 CC complementary to at least a portion of the folded target; and (b) mixing
 CC the target and probes so that the probe hybridises to form a probe
 CC /folded target complex. Also provided are methods for determination of
 CC structure formation in nucleic acid targets; for analysing folded nucleic
 CC acids targets; and for analysis and characterisation of nucleic acid
 CC sequences to detect the presence of pathogenic nucleic acid sequences
 CC indicative of an infection, the presence of variants or alleles of
 CC mammalian genes associated with disease and cancers, and the
 CC identification of the source of nucleic acids found in forensic samples,
 CC as well as in paternity determinations. The methods allow simultaneous
 CC analysis of both strands (e.g. the sense and antisense strands) and are
 CC ideal for high-level multiplexing. The products produced are amenable to
 CC qualitative, quantitative and positional analysis. The methods may be
 CC performed in solution or in the solid phase (e.g. on a solid support).
 CC The methods are powerful in that they allow for analysis of longer
 CC fragments of nucleic acid than current methodologies. The present
 CC sequence represents a control probe that can hybridise to all HCV
 CC variants

PT Nucleic acid amplification involving primer extension preamplification,
XX especially for whole genome amplification.
XX
PS Example 6; Page 7; 24pp; German.
XX
CC This invention describes a novel method for the amplification of nucleic
CC acid fragments from a sample in two or three thermal cycling reactions
CC using random primers in the first reaction and specific primers in the
CC second reaction is new and comprises using a mixture of at least two DNA
CC polymerases, at least one of which has 3'-5' exonuclease activity. The
CC process is useful for whole genome amplification by primer extension
CC preamplification polymerase chain reaction (PEP-PCR). DNA amplified by
CC the process can be used for mutation analysis, as a template for
CC sequencing reactions, or for microsatellite analysis. The use of a
CC mixture of DNA polymerases, including at least one with proofreading
CC ability, results in increased sensitivity, such that cell-specific
CC amplification products can be generated with a probability of more than
CC 90% from samples containing no more than 100 cells, preferably no more
CC than 5-10 cells. AAZ09799-209815 represent PCR primers used in the method
CC of the invention

XX Detection of drug-selected mutations in the HIV protease gene used to
PT treat HIV infections.

PS Claim 3; Page 43; 76pp; English.

XX The present invention describes the detection of drug-selected mutations
CC in the HIV protease gene. The method of detection allows the simultaneous
CC characterisation of a range of codons involved in drug resistance using
CC sets of probes optimised to function together in a reverse-hybridisation
CC assay. AAZ97517 to AAZ97997 represent specifically claimed probes for use
CC in the assay, and AAZ97479 to AAZ97501 represent specifically claimed HIV
CC protease gene polymorphic nucleotide sequences. AAZ97502 to AAZ97515, and
CC AAZ98004 to AAZ98007, represent PCR primers for the HIV protease gene.
CC and AAZ97516 represents an HIV protease probe used in an example from the
CC present invention. The method, probes and primers can be used for the
CC detection of drug-selected mutations in the HIV protease gene. The method
CC allows the simultaneous characterisation of a range of codons involved in
CC drug resistance. The method may also be used for HIV protease genotyping
CC assays. The probes are able to discriminate between wild type and mutated
CC protease sequences. The method allows rapid and reliable detection of
CC drug-selected mutation in HIV. (Updated on 15-SEP-2003 to standardise OS
CC field)

XX		
XX	Example 1; Page 306; 7179P; English.	

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-1b (PTB-1b), methionine aminopeptidase (MeAP-2), human telomerase (hTERT), protein kinase C alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (HER2/c-erbB/neu), phospholamban (PLN), premenin-1 (ps-1), premenin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, zinczyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breast cancer. Alzheimer's disease, diabetes, obesity, cardiac diseases e.g. heart disease, age-related diseases, hepatitis B infections, and hepatitis and hepatocellular carcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells and to detect the presence of specific RNA in a cell. The present sequence represents a substrate/target sequence for a ribozyme used in the examples of the present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences associated with them.

 PT Isolated nucleic acid molecules having polymorphisms in known human genes
 PT e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers
 PT for locating, identifying and characterizing the genes responsible for
 PT disorder-related traits.
 XX
 PS Example 2; Page 101, 714pp; English.
 XX
 CC This invention relates to the sequence of an isolated nucleic acid
 CC molecule comprising at least one base variation from that of a known
 CC human cytochrome P450 A1 (CYP4501A1), cytochrome P450 A2 (CYP4501A2),
 CC cytochrome P450 02E1 (CYP45002E1), adrenergic receptor beta1 (ADRB1),
 CC aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator
 CC (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding
 CC inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating
 CC protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl
 CC transferase (HNMT), (kallikrein 2) KLK2, nicotinamide -N-methyl
 CC transferase (NMNT), NADPH quinone oxidoreductase 2 (NQO2),
 CC sulfoxidoreductase thermolabile (STM), UDP-glucuronosyl transferase 2B4
 CC (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl

CC transferase (UGT2B15), urokinase receptor (uPA), multidrug resistance 1
 CC (MDR1), lactotransferrin (LTF), multidrug resistance associated protein 3
 CC (MRP3), orphan nuclear receptor (NR112), or acetylcholine muscarinic
 CC receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence.
 CC The polymorphisms in the human genes cited in the invention are useful as
 CC genetic linkage markers for locating and characterizing the genes that
 CC are responsible for specific traits within the genome and eventually
 CC identifying the genes responsible for a variety of disorder-related
 CC traits as a result of their e.g., overexpression, constitutive
 CC expression, mutation or underexpression, which may be used in diagnosing
 CC and/or treating the disorders. The nucleic acid molecules comprising the
 CC polymorphic sequences contained in CYP4501A1, CYP4501A2, CYP4502E1,
 CC ARNT, EPHX2, GST12, NMNT, NQO2, NR112, STM, UGT2B4, UGT2B7, UGT2B15, AHR,
 CC MDR1 and/or MDR3 are useful for screening individuals for altered drug
 CC metabolism. The polymorphic sequences contained in CYP4501A1, CYP4501A2,
 CC AHR, MDR1 and/or MDR3 may also be used to screen individuals for
 CC susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are
 CC used to screen for altered cardiovascular function, in COX2 for altered
 CC susceptibility to colorectal tumours, in DBI or CHMR1 for altered central
 CC nervous system function, in FLAP and HNMT for altered pulmonary,
 CC immunological or haematological function, in KLK2 for altered serine
 CC protease activity in the prostate, in LTF for altered immunological or
 CC haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and
 CC peripheral nervous system function. The present sequence represents a
 CC sequencing primer used to sequence the polymorphic genes of the invention

 XX
 PS Claim 10; Page 263; 345pp; Japanese.
 XX

CC The invention relates to a typing kit for judging human leukocyte antigen
CC (HLA) genotype of a sample by hybridising a substrate on which 10-24 base
CC oligonucleotides (ABLJ0512-ABLJ1809) originating in the sequences of
CC genes e.g. belonging to HLA class I antigens on human genome and
CC containing gene polymorphisms as alloantigens have been immobilised as
CC primers for amplification of cleaved nucleic acids relating to gene
CC polymorphisms. The method is useful for judging HLA genotypes of
CC individuals by determining immunogenetic differences before transplanting
CC organ and tissue for transplantation e.g. of bone marrow, kidney, liver,
CC pancreas, langerhans islet in pancreas and cornea, susceptibility
CC diagnosis of genetic diseases and identifying individuals

XX useful for treating e.g. cancer or Alzheimer's disease.
XX
XX Claim 1; Page 41; 0pp; English.
XX
XX The present invention relates to compounds capable of modulating hypoxia-
XX inducible factor-1alpha (HIF1a). The compounds are used to treat patients
XX with, or at risk of developing, cancer (e.g. of breast, prostate,
XX pancreas, lung), pre-eclampsia, inflammatory bowel disease or Alzheimer's
XX disease, for modulating angiogenesis, proliferation of erythrocytes and
XX other cells, iron, glucose and energy metabolism, pH regulation, tissue
XX invasion, apoptosis, multiple drug resistance, cellular stress responses,
XX and matrix metabolism, especially apoptosis where modulation is
XX sensitivity to an apoptotic stimulus, particularly a chemotherapeutic
XX agent and for inhibiting proliferation of cells (especially cancer cells)
XX in vitro. The present sequence is an antisense oligonucleotide against
XX HIF1alpha identified in the exemplification of the invention

PT bronchodilating agent.
XX
XX
XX Claim 15; SEQ ID NO 10823; 763pp; English.
XX
XX
XX This invention describes a novel composition (a) a first active agent,
CC comprising oligonucleotides, effective for alleviating
CC bronchoconstriction, respiratory tract inflammation, allergies and
CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors,
CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has anti-allergic, anti-inflammatory, antistatic,
CC analgesic, hypotensive, immunosuppressive and cytosolic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hyperextension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

XX PT Analyzing nucleic acids, comprises mixing target nucleic acid such as
XX PT hepatitis C virus nucleic acid, bridging oligonucleotide, second
XX PT oligonucleotide and cleavage agent to form cleavage structure.
XX PS Example 8; SEQ ID NO 66; 143bp; English.

CC The invention describes a method of analysing nucleic acids comprising
CC providing a target nucleic acid, e.g. hepatitis C virus nucleic acid
CC having non-contiguous single-stranded regions (NCSR) separated by an
CC intervening region, a bridging oligonucleotide capable of binding to the
CC first and second NCSR; a second oligonucleotide binding to a portion of
CC the first NCSR and a cleavage agent, and mixing the contents to form a
CC cleavage structure. The method is useful for analysing nucleic acids,
CC e.g. hepatitis C virus nucleic acid useful for clinical diagnostic
CC purposes and detection and identification of pathogenic microorganisms
CC such as hepatitis C virus. This sequence represents a probe associated
CC with the nucleic acid analysis method of the invention.

DR Predicting responsiveness of a subject with breast cell proliferative

PT disorder, useful for treating or differentiating breast cell

PT proliferative disorders comprises analyzing methylation pattern of a

PT genomic DNA from the subject.

XX Disclosure; SEQ ID NO 1910; 104pp; English.

CC The invention relates to a novel method for predicting the responsiveness of a subject with a cell proliferative disorder of the breast tissues to a therapy comprising analysing the methylation pattern of a target nucleic acid by contacting at least one of the target nucleic acids in a biological sample obtained from the subject prior to or during treatment. The method of the invention has cyrostatic activity, and may have a use in gene therapy. The set of oligonucleotides comprising at least two of the oligomers are useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) within the sequences. The methods, nucleic acid, oligonucleotide, and kit are useful for the treatment, characterisation, classification and/or differentiation, of breast cell proliferative disorders. The method is also useful for predicting the responsiveness of a subject with a cell proliferative disorder of the breast tissues to a therapy. The present sequence is used in the exemplification of the invention.

PT Novel isolated nucleic acid molecule, useful for identifying individual
PT who has altered risk for developing cardiovascular disorder or altered
PT likelihood of responding to statin treatment.
XX
PS Claim 21; SEQ ID NO 85290; 200pp; English.
XX

CC The invention relates to an isolated nucleic acid molecule comprising 8
CC or more contiguous nucleotides, where one of the nucleotides is a single
CC nucleotide polymorphism (SNP). The invention also relates to a method of
CC identifying an individual who has an altered risk for developing a
CC cardiovascular disease or an altered likelihood of responding to statin
CC treatment, involving detecting a SNP in the individual's nucleic acids,
CC where the presence of the SNP is correlated with an altered risk for
CC developing a cardiovascular disease or responding to statin treatment,
CC and a method of treating a cardiovascular disease in an individual
CC involving administering to the individual an effective amount of statin
CC based on the individual's likelihood of responding to statin treatment as
CC predicted by the alleles present at one or more SNP sites. The nucleic
CC acids and the related polypeptides are useful for identifying an agent
CC useful for therapeutically or prophylactically treating cardiovascular
CC diseases which involves contacting a nucleic acid with a candidate agent
CC under conditions suitable to allow formation of a binding complex between
CC the nucleic acid and the candidate agent and detecting formation of the
CC binding complex, where the presence of the complex identifies the agent.
CC The cardiovascular disease is an acute coronary event chosen from
CC myocardial infarction, stroke, atherosclerosis, cerebrovascular disease,
CC unstable angina, coronary artery disease, congenital heart defect and
CC congestive heart failure. This sequence represents a PCR primer used in
CC genotyping of nucleic acid molecules of the invention.

XX This invention describes novel oligonucleotide primers or peptide nucleic
XX acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
XX and cytosine methylation status in chemically pretreated genomic DNA. The
XX oligonucleotides are used for diagnosis and/or prognosis of cancer and a
XX range of diseases including immune system, gastrointestinal, respiratory,
XX central nervous system, cardiovascular and metabolic disorders. The
XX oligomers are also used for detecting cell type differentiation. ABC00010
XX -ABC99989, ABF00010-ABP99989, ABH00010-ABH99989 and ABH00010-ABH82073
XX represent the oligomers described in the invention. NOTE: The sequence
XX data for this patent did not form part of the printed specification, but
XX was obtained in electronic format from WIPO at
XX ftp.wipo.int/pub/published_pct_sequences

XX
XX New polynucleotide containing polymorphisms in the human sodium channel
XX voltage gated type 2 beta polypeptide (SCN2B) gene, for developing drugs
XX for treating demyelinating diseases.
XX
XX Claim 15; Page 13; 63pp; English.
XX
XX

XX This invention relates to an isolated polynucleotide which is a
CC polymorphic variant of a reference sequence for sodium channel voltage
CC gated type 2 beta polypeptide (SCN2B) gene. The methods have
CC applicability in developing diagnostic tests and therapeutic treatments
CC for demyelinating diseases. The protein is useful for studying the
CC expression and function of SCN2B and expressing SCN2B protein for use in
CC screening for candidate drugs to treat diseases related to SCN2B
CC activity. The polymorphism and haplotype data are useful for validating
CC whether SCN2B is a suitable target for drugs to treat demyelinating
CC diseases, screening for such drugs and reducing bias in clinical trials.
CC The haplotyping method is useful to validate SCN2B as a candidate target
CC for treating a specific condition or disease predicted to be associated
CC with SCN2B activity. A recombinant non-human organism transformed or
CC transfected with the polypeptide is useful for studying expression of the
CC SCN2B isogenes in vivo, for in vivo screening and testing of drugs
CC against SCN2B protein and for testing the efficacy of therapeutic agents
CC and compounds for demyelinating diseases in a biological system. This
CC sequence is used during the detection of polymorphisms of the SCN2B gene

DR
XX
XX New genetic variants of human cytotoxic T-lymphocyte-associated protein
PT 4, CTLA4 gene for studying expression, function of the gene and
PT expressing CTLA4 protein useful in identifying drugs to treat autoimmune
PT disorder.
XX
XX Claim 17; Page 12; 62pp; English.

XX The invention relates to single nucleotide polymorphisms in the gene
CC encoding the human cytotoxic T-lymphocyte-associated protein 4 or CTLA4
CC protein. A method for haplotyping the CTLA4 gene in an individual
CC comprises identifying the nucleotide at one or more polymorphic sites and

CC determining whether one of the copies of the gene is defined by one of
CC the CTLA4 haplotypes given in the specification or whether both copies
CC are defined by a haplotype pair. This method is useful in genotyping,
CC whereby all possible haplotype pairs can be assigned to specific
CC genotypes. An association between a trait and a haplotype or haplotype
CC pair of the CTLA4 gene can be identified by comparing the frequency of
CC the haplotype or haplotype pair in a population exhibiting the trait with
CC the frequency of the haplotype or haplotype pair in a reference
CC population, where a higher haplotype frequency in the trait population
CC indicates the trait is associated with the haplotype or haplotype pair.
CC CTLA4 and its corresponding DNA are used for studying the expression and
CC function of CTLA4, for use in screening for candidate drugs to treat
CC diseases related to CTLA4 activity, such as autoimmune disorders. The
CC sequences are also useful for studying the effect of variation on the
CC biological activity of CTLA4 as well as on the binding affinity of
CC candidate drugs targeting CTLA4. Sequences ABK27518-ABK27549 represent
CC allele-specific oligonucleotide probes, sequencing primers and PCR
CC primers used to detect CTLA4 gene polymorphisms

XX New genetic variants of Small Inducible Cytokine Subfamily A (Cys-Cys),
PT Member 8 (Monocyte Chemotactic protein) isogenes, useful for improving
PT efficiency and reliability in drug development for treating diseases.
XX
XX Claim 16; Page 13; 84pp; English.

XX The present invention relates to novel single nucleotide polymorphisms
CC (SNPs) in the human small inducible cytokine subfamily A (Cys-Cys),
CC member 8 (monocyte chemotactic protein) (SCY8) gene located on
CC chromosome 17, and methods for haplotyping and/or genotyping the SCY8
CC gene. The methods of the invention make use of allele-specific
CC oligonucleotides (ASOs) as probes and primers and/or primer-extension

CC oligonucleotides for detecting the SCY8 gene polymorphisms. The
CC polynucleotides and screened compounds are useful for the treatment of
CC diseases associated with SCY8A activity, such as inflammatory diseases
CC and human immunodeficiency virus (HIV) infection. ABK0720-ABK0743
CC represent ASO primers for detecting human SCY8A gene polymorphisms

XX Isolated human chemokine receptor 4 polynucleotide, useful for studying
PT expression and function of chemokine receptor 4 and for treating human
PT immunodeficiency virus-1.

XX Disclosure; Page 13; 54pp; English.

XX The invention relates to an isolated chemokine receptor 4 (CXCR4)

CC polynucleotide which is useful for studying expression and function of
CC chemokine receptor 4 and for the treatment of viruses, including HIV-1.

CC Methods associated with chemokine receptor 4 are useful for improving the
CC efficacy and reliability of several steps in the discovery and

CC development of drugs for treating diseases associated with CXCR4
CC activity, e.g., human immunodeficiency virus-1 infection. They can

CC validate CXCR4 as a candidate agent for treating a specific condition or
CC disease predicted to be associated with CXCR4 activity, and in the design

CC of clinical trials of candidate drugs for treating a specific condition
CC or disease predicted to be associated with CXCR4 activity. CXCR4

CC polynucleotides are useful for therapeutic purposes such as to treat HIV-
CC 1 infection and also are useful for studying expression of the CXCR4

CC isogenes in vivo. This sequence represents a ASO primer used to detect
CC CXCR4 gene polymorphisms

XX Example 1; Page 8; 36pp; English.

XX The core region of human NK1R 5' was isolated by PCR and sequenced (see

CC AAQ30774-Q30778). The antisense primers hsp15a2, hsp15a1, hsp15a2,

CC hsp16a1 and hsp16a2 (AAQ30784-Q30788) were synthesised based on the human

CC core sequence. Human glioblastoma mRNA and each of these primers were

CC used in first strand cDNA synthesis to produce the template for a primary

CC PCR amplification. Primer hsp15a5 was used with 2 rat sense primers hsp1n

CC and hsp1n (AAQ30779 and AAQ30780) for the primary amplification. The PCR

CC product was then used as template for secondary PCR with the same rat

CC primers and the human antisense primer hsp13a4 (AAQ30783). The secondary

CC PCR product was the template for tertiary PCR amplification, again using

CC the same rat sense primers but with human antisense primer hsp13a1

CC (AAQ30782). The amplified DNA fragment hybridised to hsp13a2 (AAQ30781),

CC indicating it is not a non-specific by-product. The DNA was sequenced and

CC found to encode the human NK1R 5' N-terminal region and also contains a

XX 5' UTR. (Updated on 25-MAR-2003 to correct PN field.)

The invention relates to a method of treating a pathological condition characterised partially by involvement of neurokinin receptor-1 (NK-1) receptor, especially treating, attenuating or preventing pain or inflammatory condition. The method comprises administering to a mammal, a compound chosen from an oligonucleotide, its analogue, and a disruptor which interferes with function or production of NK-1 receptors. The method is useful for treating a pathological condition characterised by involvement of NK-1 receptor such as dermatological, immune, autoimmune, cardiovascular, vascular disorders (e.g. migraine), airway, neuropathic, psychiatric and central nervous system disorders (e.g. anxiety, psychosis, schizophrenia), gut inflammation, arthritis, and central or peripheral aspects of chronic or acute pain, and for treating, attenuating or preventing pain or inflammation such as peripheral, chronic, acute pain or inflammation, neuropathic pain, inflammation or pain relating to psychiatric disorders and central nervous system disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia in a mammal, in particular human. NK-1 receptor related disorders, diseases, or pathological conditions treatable by this method include respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic conditions (e.g. conjunctivitis), cutaneous/dermatological conditions (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and Crohn's disease), cardiovascular conditions (stroke), chronic gastrointestinal tract inflammation, and inflammatory diseases such as

CC inflammatory bowel diseases. Other disorders and diseases include
CC cardiovascular pathologies including stroke, chronic inflammatory
CC diseases such as rheumatoid arthritis, demyelinating diseases such as
CC multiple sclerosis, small cell lung cancer, depression, hypersensitivity
CC disorders such as allergies and poison ivy, vasospastic diseases such as
CC angina, addiction disorders such as alcoholism, neurodegenerative
CC disorders such as acquired immune deficiency syndrome (AIDS) related
CC dementia, epilepsy, Alzheimer's disease, and other neuro-pathological
CC disorders such as peripheral neuropathy, oedema, stress related and
CC somatic disorders, and osteoarthritis. Antisense oligonucleotides
CC effectively treat chronic conditions and other pathological states
CC without the co-administration of substance P, and reduce the number of
CC activated receptors while not reducing the number of quiescent NK-1
CC receptors. Receptors not chronically stimulated are less affected,
CC reducing side effects of treatment. ABK63834-ABK63906 represent NK-1

XX Treating pathological condition involving neurokinin receptor-1, e.g.
PT pain or inflammation, by administering oligonucleotide or a non-
PT nucleotide disruptor compound which modulate NK-1 receptor biosynthetic
PT pathway.
XX
XX Claim 24; Page 20; 100pp; English.

The invention relates to a method of treating a pathological condition characterised partially by involvement of neurokinin receptor-1 (NK-1)

receptor, especially treating, attenuating or preventing pain or inflammatory condition. The method comprises administering to a mammal, a compound chosen from an oligonucleotide, its analogue, and a disruptor which interferes with function or production of NK-1 receptors. The method is useful for treating a pathological condition characterised by involvement of NK-1 receptor such as dermatological, immune, autoimmune, cardiovascular, vascular disorders (e.g. migraine), allergy, neuropathic, psychiatric and central nervous system disorders (e.g. anxiety, psychosis, schizophrenia), gut inflammation, arthritis, and central or peripheral aspects of chronic or acute pain, and for treating, attenuating or preventing pain or inflammation such as peripheral, chronic, acute pain or inflammation, neuropathic pain, inflammation or pain relating to psychiatric disorders and central nervous system disorders, including hyperalgesia, allodynia, neuralgia and dysesthesia in a mammal, in particular human. NK-1 receptor related disorders, diseases, or pathological conditions treatable by this method include respiratory conditions (e.g. asthma, allergic rhinitis), ophthalmic conditions (e.g. conjunctivitis), cutaneous/dermatological conditions (allergic dermatitis), intestinal conditions (e.g. ulcerative colitis and Crohn's disease), cardiovascular conditions (stroke), chronic gastrointestinal tract inflammation, and inflammatory diseases such as inflammatory bowel diseases. Other disorders and diseases include cardiovascular pathologies including stroke, chronic inflammatory diseases such as rheumatoid arthritis, demyelinating diseases such as multiple sclerosis, small cell lung cancer, depression, hypersensitivity disorders such as allergies and poison ivy, vasospastic diseases such as angina, addition disorders such as alcoholism, neurodegenerative disorders such as acquired immune deficiency syndrome (AIDS) related dementia, epilepsy, Alzheimer's disease, and other neuro-pathological disorders such as peripheral neuropathy, edema, stress related and somatic disorders, and osteoarthritis. Antisense oligonucleotides effectively treat chronic conditions and other pathological states without the co-administration of substance P, and reduce the number of activated receptors while not reducing the number of quiescent NK-1 receptors. Receptors not chronically stimulated are less affected, reducing side effects of treatment. ABK63834-ABK63906 represent NK-1 receptor coding sequences and oligonucleotides of the invention

Identifying genetic profile associated with a neurological, psychiatric, or psychological condition, comprises screening individuals for a polymorphism in a genetic locus comprising the dopamine receptor D2 (DRD2) gene.

Claim 31; SEQ ID NO 1323; 634bp; English.

The invention relates to a method of identifying a genetic profile associated with a neurological, psychiatric or psychological condition, phenotype or state including a sub-threshold neurological, psychiatric or psychological condition, phenotype or state in an individual, comprising screening individuals for a polymorphism in a genetic locus comprising the dopamine receptor D2 (DRD2) gene. The invention also relates to a genetic mutation providing a genetic marker for a neurological, psychiatric, or psychological condition, state or phenotype in an individual, where the presence of a 957C polymorphism is indicative of a predisposition to developing a neurological, psychiatric or psychological condition, phenotype or state. The compositions and methods are useful for identifying a genetic profile associated with a neurological, psychiatric or psychological condition. The method enables clinicians to make a genetic-based diagnosis and can thereby implement treatment or preventative or symptom-ameliorating protocols to reduce the adverse consequences of the condition. This sequence represents a human dopamine receptor D2 (DRD2) DNA oligonucleotide used in the scope of the invention.

XX		

Disclousre; Page 35, 76pp; English.

The invention relates to production of a composition for delivering a gene (I) to muscle cell or tissue and involves mixing (a) recombinant adeno-associated virus (AAV) virion consisting of an AAV vector including (1) Linked to suitable control elements and (b) a vehicle. (I) is delivered to skeletal muscle (myoblasts or myocytes), smooth muscle or cardiac muscle (cardiomyocytes). It is under control of a muscle-specific or inducible promoter, e.g. the promoter of the myod gene or steroid-responsive elements. The virions are used to express therapeutic proteins in muscle, specifically acid alpha-glucosidase in cardiomyocytes (for treating type II glycogen storage disease (Pompe's disease), an inherited cardiomyopathy caused by deficiency of acid alpha-glucosidase), but also erythropoietin and more generally any protein capable of treating endocrine, metabolic, haematological and cardiovascular diseases, including e.g. AIDS, cancer and diabetes, including delivery of antigens for immunisation. The virions are injected directly into muscle or they are used to transduce cells in vitro for subsequent return to the patient. The present sequence represents an oligonucleotide used in the construction of a vector pJ909adhlaC2

PT cancers.
XX
XX Claim 18; Page 453; 1343pp; English.
PS
XX The present invention describes a new composition comprising an antisense
XX oligonucleotide (ON) with low adenosine (up to 15%), which targets
XX nucleic acids involved in bronchoconstriction, allergies, and/or
XX inflammation. The ON can have antiinflammatory, antiallergic,
XX antiasthmatic, cyostatic and analgesic activities. The compositions are
XX useful for the treatment of diseases associated with inflammation,
XX impaired airways, including lung disease and diseases whose secondary
XX effects afflict the lungs of a subject. They can be used for treating
XX e.g. ischemic conditions, pulmonary vasoconstriction, allergies, asthma,
XX impaired respiration, respiratory distress syndrome, pain, cystic
XX fibrosis, pulmonary hypertension, emphysema, chronic obstructive
XX pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
XX carcinomas, and cancers which may metastasise to the lungs, including
XX breast and prostate cancer. The reduction of the adenosine content of the
XX ONs reduces side effects. The A-containing ONs break down with the
XX release of deoxyadenosine which activates adenosine receptors causing
XX bronchoconstriction and inflammation. AAA33313 to AAA35312 represent the
XX nucleotide sequences given in the sequence listing from the present
XX invention, which correspond to SEQ ID NO:1 to 2815, and then the last 1653

CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA2323 to AAA3392) are specifically claimed ONS from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences given in the sequence listing

XX Novel ribozymes for the treatment of diseases and conditions related to

XX hepatitis C infection.

XX Claim 2; Page 96; 123pp; English.

XX The present sequence represents the preferred target sequence of an

XX enzymatic nucleic acid, especially a hairpin ribozyme, which cleaves the

XX Hepatitis C virus (HCV) RNA sequence at the base position given in the

XX descriptor line. The HCV sequence was screened for optimal ribozyme

XX target sites using a computer folding algorithm and regions of the mRNA

XX which did not form secondary folding structures and contained potential

XX ribozyme cleavage sites were identified. Ribozymes were synthesized to

XX target these sites and their activities optimised by either varying the

XX length of the binding arms or by modification to prevent degradation by

XX nucleases. The ribozymes of the invention inhibit gene expression and/or

XX viral replication, and are used to treat diseases associated with

XX Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and

XX hepatocellular carcinoma. The ribozymes may be used in combination with

XX interferon to treat HCV infection, other infectious diseases, autoimmune

XX diseases, and cancer

XX Composition containing immune stimulant and inhibitor of agent that

XX adversely affects the immune response, for treating cancers and

XX infections.

XX Claim 10; Fig 1; 30pp; English.

XX This sequence is an immunosuppressant inhibitor oligonucleotide, which is

XX used in the invention. The invention relates to a composition which

XX contains at least one inhibitor (less than 100 kb) of a substance (e.g.

XX transforming growth factor TGF-beta, vascular endothelial growth factor

XX VEGF, interleukin-10, IL-10, prostaglandin E2 PGE2, or their receptors)

XX that adversely affects the immune response. The composition also includes

XX at least one stimulant that positively affects the immune response. This

XX oligonucleotide is an example of an inhibitor that is used in the

XX composition. The composition is used as an immunostimulant for the

XX treatment of neoplasms and infections, particularly hyperproliferation;

XX leukemias; (non-)Hodgkin's lymphoma; carcinoma (of oesophagus, bronchi,

XX colon-rectum, stomach, intestine, gall bladder or duct, pancreas, anus,

XX breast, ovary, cervix, endometrium, prostate or bladder), liver tumours,

XX malignant melanoma, brain tumours and sarcomas. The oligonucleotides,

XX most of which are directed against TGFbeta or VEGF, are inhibitors of

XX monocyte chemoattractant protein-1 (MCP-1) and are useful as anti-

XX inflammatory for treating e.g. asthma, Crohn's disease, ulcerative

XX colitis, diabetes, glomerulonephritis, acute respiratory distress

XX syndrome and the formation of atherosclerotic plaque

PS The invention relates to an enzymatic nucleic acid molecule which
CC specifically cleaves minus strand RNA derived from hepatitis C virus
CC (HCV). The binding arms of the molecule comprise ribozyme sequences. The
CC molecule is selected from inozyme, G-cleaver, DNazyme, Amberzyme, and
CC zinczyme motifs. Also described: (1) a pharmaceutical composition
CC comprising the novel enzymatic nucleic acid; (2) a mammalian cell
CC including a nucleic acid sequence encoding at least one enzymatic
CC nucleic acid molecule, in a manner, which allows expression of that
CC molecule; (4) a mammalian cell including an expression vector of (3); (5)
CC methods for treating cirrhosis, liver failure or hepatocellular carcinoma
CC by administering to a patient the novel enzymatic nucleic acid or the
CC vector of (3); (6) a method of treating a patient having a condition
CC associated with HCV infection, by contacting cells of the patient with
CC the nucleic acid molecule, and further employing one or more drug
CC therapies; (7) a method for inhibiting HCV replication in a mammalian

CC cell by administering the novel enzymatic nucleic acid; and (8) a method
CC of cleaving a separate RNA molecule by contacting the novel enzymatic
CC nucleic acid with the separate RNA molecule. The enzymatic nucleic acid
CC is useful for modulating the expression and/or replication of hepatitis C
CC virus (HCV), and for inhibiting the expression of HCV minus strand. The
CC nucleic acid may also be used to treat or prevent the occurrence of a
CC disease state in a patient. The present sequence represents an HCV
CC hairpin ribozyme target substrate sequence which is used in the
CC exemplification of the present invention.

PT A recombinant adeno-associated virus-vectorized ribozyme composition,
PT useful for treating a disease or dysfunction of the mammalian eye e.g.
PT retinal disease, e.g. diabetic retinopathy or age-related macular
PT degeneration.
XX
PS Claim 1; Page 61; 115pp; English.
XX
PS The present invention describes a recombinant adeno-associated virus
CC (AAV) vectorized ribozyme composition (I). (I) comprises: (a) at least a
CC first ribozyme that specifically cleaves an mRNA encoding a protein,
CC polypeptide, or peptide selected from the group of rod opsin, inos,
CC RGS/peripherin, VEGFR1, VEGFR2, adenosine A-2B receptor, IGF-1, integrin
CC alpha 1, integrin alpha 3, integrin alpha 5, or integrin alpha V; (b) a
CC vector comprising a polynucleotide encoding the ribozyme, where the
CC polynucleotide operably positioned downstream of at least a first
CC promoter that directs expression of the polynucleotide in a selected
CC mammalian cell transformed with the vector; (c) a viral particle
CC comprising the ribozyme or the polynucleotide; (d) an AAV vector
CC comprising the ribozyme or the polynucleotide; or (e) a host cell
CC comprising the ribozyme or the polynucleotide. Also described is a method
CC for decreasing the amount of mRNA encoding a selected polypeptide in a

CC retinal cell of a mammalian eye, comprising providing to the eye the
CC composition described above, and for a time effective to specifically
CC cleave the mRNA in the cell. (I) has ophthalmological activity, and can
CC be used in gene therapy. (I) can be used for treating a disease or
CC dysfunction of the mammalian eye, such as a retinal disease or retinal
CC dysfunction, (diabetic) retinopathy, or (age-related) macular
CC degeneration. (I) is also useful for manufacturing a medicament for
CC treating the diseases mentioned above, including autosomal dominant
CC retinitis or a blood-retinal barrier dysfunction. (I) can also be useful
CC for treating, decreasing the severity, or ameliorating the symptoms of a
CC pathological condition, e.g. atrophic or pigmented lesions of the eye,
CC blindness, a reduction in central or peripheral vision, or a reduction in
CC total vision. AB2726763 to AB272953 represent sequences used in the

AA Pharmaceutical composition for treating ailments associated with impaired
PT respiration, has oligo(s) antisense to specific gene(s) or its
PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
PT ublquinone.

PS Disclosure; SEQ ID NO 10880; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has as first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an

antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiaesthetic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antitense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine or receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIGO at [ftp.wigo.int/pub/published_pct_sequences](http://wigo.int/pub/published_pct_sequences)

PT
PT
PT

Pharmaceutical composition for treating asthma, has antihense
oligonucleotide containing less percentage of adenosine, targeted to
nuclear acids associated with lung airway or lung dysfunction, and
bronchodilating agent.

Claim 15; SEQ ID NO 10880; 763pp; English

AA this invention describes a novel composition (a), a first active agent, CC comprising oligonucleotides, effective for alleviating allergies and CC comprising oligonucleotides, effective for alleviating allergies and CC bronchoconstriction, respiratory tract inflammation, allergies and CC bronchoconstriction, respiratory tract inflammation, allergies and CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors

CC surfactant depletion or hyposecretion, when administered to a mammal. The
CC oligonucleotides are derived from a gene encoding or regulating
CC expression of a target polypeptide associated with lung airway or lung
CC dysfunction or cancer and can be anti-sense to the corresponding mRNA.
CC The invention also describes a kit, that comprises: (a) a delivery
CC device, in separate containers, (b) the oligonucleotides, (c)
CC instructions for adding a carrier and for use of the kit. The composition
CC of the invention has anti-allergic, anti-inflammatory, antiasthmatic,
CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
CC beta-adrenergic agonist. The composition is useful for preventing or
CC treating a respiratory, lung or malignant disease. The administered
CC composition comprises oligo and is administered to reduce the production
CC or availability, or to increase the degradation of the target mRNA or to
CC reduce the amount of target polypeptide present in the lungs. The
CC pulmonary obstruction, and/or bronchoconstriction and/or lung
CC inflammation, allergies and/or surfactant hypoproduction are associated
CC with a disease or condition such as pulmonary vasoconstriction,
CC inflammation, allergies, asthma, impeded respiration, respiratory
CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
CC hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary
CC transplantation rejection, pulmonary infections, bronchitis or cancer.
CC The reduced adenosine content of the anti-sense oligos corresponding to
CC thymidines present in the target RNA serves to prevent the breakdown of
CC the oligonucleotides into products that free adenosine into the system
CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
CC prevent any unwanted effects due to it

PT Substrate for use in optically detecting target materials, comprises an
PT oxide layer having thickness that may vary to wavelength of excitation
PT light used.
XX
PS Example 1; SEQ ID NO 36; 20pp; English.
XX
CC The present invention relates to a novel substrate having an oxide layer.

CC which is useful in optically detecting a target material. The thickness
CC of the oxide layer may vary to the wavelength of excitation light used.
CC Also claimed is a method for detecting a target material, comprising
CC immobilizing a probe material on a substrate, reacting the immobilized
CC probe material and the target material, illuminating a reaction product
CC with excitation light, and measuring light emitted from the reaction
CC product by the excitation light. In an example from the invention,
CC microarrays were fabricated by forming fused silica (SiO2) layers on
CC silicon wafers, followed by linkage with a coupling agent and
CC immobilization of oligonucleotide probes. The microarrays were then
CC incubated with labeled oligonucleotide and exposed to excitation light,
CC and light emitted from the target oligonucleotides was measured, to
CC evaluate the intensity of detected signals with respect to the thickness
CC of the SiO2 layers. AD285128-AD285203, MODY 3 diabetes-associated probes
CC used with the target sequence of human glyceraldehyde-3-phosphate
CC dehydrogenase (GAPDH), were used to show that when a target
CC oligonucleotide is detected using a microarray including a substrate with
CC an oxide layer a good signal is obtained compared to that with no oxide
CC layers.

XX Polynucleotide microarray for photolithographic or spotting method,
 PT comprises probe polynucleotides spots capable of binding to same target
 PT polynucleotide immobilized on microarray.

XX Example; SEQ ID NO 49; 25pp; English.

XX This invention relates to a novel polynucleotide microarray comprising at
 CC least two probe polynucleotides capable of binding to the same target
 CC polynucleotide immobilized on the microarray. A spot region on a
 CC substrate of the polynucleotide microarray is segmented into blocks
 CC arranged in rows and columns adjacent to each other. The blocks are
 CC separated and a space is formed between the blocks. The microarray may be
 CC used for photolithographic or spotting methods and provides good
 CC analytical results of a target nucleic acid. The present sequence is that
 CC of an oligonucleotide probe which was used during the exemplification of

CC the novel microarrays of the invention.

XX
XX Enzymatic nucleic acid molecules having a hammer-head motif - used for
XX the treatment of arthritis, induction of graft tolerance or treatment of
XX auto-immune diseases.
XX
XX Claim 10; Page 204; 307pp; English.
XX
XX The present invention describes a novel enzymatic nucleic acid (ENA)
XX having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues
XX ; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least
XX ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's
XX can inhibit collagenase and streptomycin production in the synovial
XX membrane of joints for the treatment or prevention of arthritis,
XX particularly osteoarthritis or rheumatoid arthritis. The ENA's can also
XX be used to treat antigen presenting cells of a donor to induce tolerance
XX in a recipient to an alloantigen of a donor. They can also be used for
XX enhancing graft tolerance or for treating autoimmune disease, and for
XX treating allergies and other inflammatory conditions. The ENA's can also
XX be used in diagnosis. Ribozyme therapy impacts on the expression of
XX streptomycin without introducing the non-specific effects upon gene
XX expression which accompany treatment with retinoids and dexamethasone.
XX The concentration of ribozyme required to affect a therapeutic treatment
XX is lower than that required of antisense molecules, and is highly
XX specific. The present sequence is used in the exemplification of the
XX present invention

XX
XX Enzymatic nucleic acid molecules having a hammer-head motif - used for
XX the treatment of arthritis, induction of graft tolerance or treatment of
XX auto-immune diseases.
XX
XX Claim 10; Page 209; 307pp; English.
XX
XX The present invention describes a novel enzymatic nucleic acid (ENA)
XX having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues
XX ; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least
XX ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's
XX can inhibit collagenase and streptomycin production in the synovial
XX membrane of joints for the treatment or prevention of arthritis,
XX particularly osteoarthritis or rheumatoid arthritis. The ENA's can also
XX be used to treat antigen presenting cells of a donor to induce tolerance
XX in a recipient to an alloantigen of a donor. They can also be used for
XX enhancing graft tolerance or for treating autoimmune disease, and for
XX treating allergies and other inflammatory conditions. The ENA's can also
XX be used in diagnosis. Ribozyme therapy impacts on the expression of
XX streptomycin without introducing the non-specific effects upon gene
XX expression which accompany treatment with retinoids and dexamethasone.
XX The concentration of ribozyme required to affect a therapeutic treatment
XX is lower than that required of antisense molecules, and is highly
XX specific. The present sequence is used in the exemplification of the
XX present invention

XX Preparation of antisense oligo:nucleotide(s) which lack long runs of
XX consecutive guanosine or inosine - and have specific ratio of residues
XX able to form two or three hydrogen bonds, have greater activity and
XX reduced toxicity, used therapeutically or to modulate growth of cells in
XX culture.
XX
PS Claim 10; Fig 5a; 286pp; English.
XX
XX AAV48564-708 represent antisense oligonucleotides directed against the
XX jund and jund genes. Of these, only oligonucleotides AAV48565-614
XX resulted in effective downregulation of negative growth control by jund
XX or jund, while AAV48615-708 had little effect. The oligonucleotides
XX exemplify the invention. The specification describes oligonucleotides
XX that contain 8-30 nucleotides, which contain at most 8 nucleotides that
XX can each form three hydrogen bonds to cytosine; do not contain four
XX consecutive nucleotides able to form three H-bonds each to four
XX consecutive cytosines; do not contain two sequences of three consecutive
XX nucleotides each able to form three H-bonds to three consecutive
XX cytosines, and the ratio between residues able to form two H-bonds each
XX (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The
XX oligonucleotides are used to modulate expression of genes, particularly
XX the genes for p53, ErbB-2, jund, jund, TGF-beta 1 or beta 2 to control
XX proliferation of primary cell cultures (e.g. bone marrow stem, liver or
XX kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The
XX oligonucleotides can also be used to analyse function of proteins (by
XX altering their expression or activity) and therapeutically, e.g. in cases

CC of cancer or (targeting TGF) for stimulating the immune system

XX
CC This sequence represents a probe for the mRNA encoding the Xenopus laevis
CC elongation factor-1 (XELFI-1 alpha) alpha chain. The invention relates to a
CC method for the determination and screening of the biological activity of
CC a drug, with real-time monitoring of RNA transcription and synthesis
CC without using electrophoresis. The method for the determination and
CC screening of the biological activity of a drug in an RNA transcription
CC and synthesis system, comprises: addition of the test drug to the system
CC to alter the transcription and synthesis of the RNA; and determining the
CC fluorescence of 2 probe sequences capable of hybridizing with the base
CC sequence of the transcribed and synthesized RNA, where one probe is a
CC donor probe labelled with an energy donor fluorescent molecule and the
CC other probe is an acceptor probe labelled with an energy acceptor
CC fluorescent molecule. The method is used for the determination and
CC screening of the biological activity of a drug. The method allows for the
CC automatic determination of the biological activity of a drug

XX
CC The present invention describes a method for distinguishing a human
XX
CC leukocyte antigen (HLA) class I antigen or allele by a combination of
XX
CC polymerase chain reaction (PCR) using a primer pair whereby all HLA-A, -B
XX
CC or -C alleles can be amplified or using reverse hybridisation analysis
XX
CC comprising a DNA probe covalently bonded to microtitre plate wells which
XX
CC are hybridisable specifically with the base sequence of at least one
XX
CC specific HLA-A, -B or -C allele. The method is applicable in gene typing,
XX
CC judging donor-recipient compatibility during organ transplant and
XX
CC correlation analysis for diagnosis of various diseases. The method is
XX
CC simple, rapid and accurate, with possibility of mechanisation and
XX
CC automation, without the problems encountered by using the prior-art
XX
CC techniques. AAA66943 to AAA67072 represent oligonucleotide probes and PCR
XX

XX

CC The present invention relates to a method for ameliorating the effects of
CC skin disorders. The method comprises contacting the skin with an
CC antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1
CC receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of
CC inhibiting or reducing growth factor mediated cell proliferation,
CC inflammation and/or other disorders. The present sequence is an
CC oligonucleotide which can be used to design the antisense
CC oligonucleotides of the present invention (see AAF45151 and AAF45153-
CC F45161). The method is useful for ameliorating the effects of psoriasis,
CC ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis,
CC neoplasia, scleroderma, warts, benign growths, cancers of the skin, a
CC hyperneovascular condition such as a neovascular condition of the retina,
CC brain or skin, growth factor-mediated malignancies, other sclerotic
CC disease, kidney disease, hyperproliferation of the inside of blood
CC vessels or any other hyperplasia

 XX
 CC The present invention describes polynucleotides comprising single
 CC nucleotide polymorphisms (SNPs) in the human dopamine receptor D2 (DRD2).
 CC The polynucleotides may be used in assays to detect and characterize
 CC polymorphisms in DRD2 that affect its expression and activity and are
 CC involved in disorders such as schizophrenia, Parkinson's and myoclonus
 CC dystonia (MD). This information would be useful for studying the
 CC biological function of DRD2 as well as in identifying drugs targeting
 CC this protein for the treatment of disorders related to its abnormal
 CC expression or function. Polymorphisms in the DRD2 gene affect the
 CC advantageous to detect polymorphisms in the DRD2 gene and how those
 CC polymorphisms are combined in different copies of the gene. AAF70261 to
 CC AAF70308 represent human DRD2 allele specific oligonucleotide probes, and
 CC AAF70309 to AAF70404 represent human DRD2 allele specific oligonucleotide
 CC primers which are used in the detection of DRD2 polymorphisms. AAF70405
 CC to AAF70452 represent oligonucleotide primers for the detection of human
 CC DRD2 polymorphisms which are given in the exemplification of the present
 CC invention. AAF70453 to AAF70538 represent PCR primers for the human DRD2
 CC gene which are used in examples from the present invention

XX New isolated polynucleotide useful for the identification of therapeutics
PT in allergic diseases is new.
XX
PS Claim 15; Page 43; 188pp; English.
XX
CC The present invention relates to polymorphisms of the human interleukin 4
CC receptor-alpha gene (IL4R-alpha; see AAF57718 for the reference
CC sequence). Polynucleotides comprising polymorphic gene variants are
CC useful for therapeutic purposes. For example, where a patient may benefit
CC from expression of a particular IL4Ralpha protein isoform, an expression
CC vector encoding the isoform may be administered to the patient. It may
CC desirable to decrease or block expression of a particular IL4Ralpha
CC isogene, which may be done by turning off by transforming a targeted
CC organ, tissue or cell population with an expression vector that expresses
CC high levels of untranslatable mRNA for the isogene. Specific therapeutics
CC identified by these methods may be useful for allergic diseases. The
CC present sequence is a probe for human IL4R-alpha

XX Enzymatic nucleic acid molecules able to cleave separate RNA molecules
XX are used for treating cancer, Alzheimer's disease, hepatitis, diabetes,
XX obesity and heart disease.
XX
XX Example 7, Page 488; 717pp; English.
XX
XX The present invention relates to the use of enzymatic nucleic acid
XX molecules (e.g. ribozymes) to modulate gene expression. The invention of
XX also methods for their use to down regulate or inhibit the expression of
XX genes encoding protein-tyrosine-phosphatase-1b (PTN-1B), methionine
XX aminopeptidase (MEAP-2), human telomerase (hTERT), protein kinase C
XX alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor
XX receptor-2 (HER2/c-erbB2/neu), phospholamban (PLN), presenilin-1 (ps-1),
XX presenilin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic
XX nucleic acid molecules used to inhibit the expression of the said genes
XX include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme,
XX zincyme, and/or DNAzyme motifs. The methods of the invention are useful
XX for treating cancer, in particular breast cancer, Alzheimer's disease,
XX diabetes, obesity, cardiac diseases e.g. heart disease, age-related
XX diseases, hepatitis B infections, and hepatitis and hepatocellular
XX carcinoma. The enzymatic nucleic acid molecules can also be used as
XX diagnostic tools to examine genetic drift and mutations within diseased
XX cells and to detect the presence of specific RNA in a cell. The present
XX sequence represents a substrate/target sequence for an anti-HER2 NCH
XX ribozyme used in the examples of the present invention. Note, Some SEQ ID
XX Nos are repeated more than once in the specification, but these have
XX different sequences associated with them.

PT	Identifying oligonucleotides hybridizing to nucleic acids containing
PT	secondary structure, useful in clinical diagnosis, comprises identifying
PT	primers that interact with the target to form an extension product under
XX	amplification conditions.
XX	
PS	Claim 48; Fig 79A; 40pp; English.
XX	
CC	The present invention describes a method for identifying oligonucleotides
CC	with desired hybridisation properties to nucleic acid targets containing
CC	secondary structure. The method comprises amplifying a target nucleic
CC	acid having at least one accessible and one inaccessible site. Primers
CC	that form an extension product are identified as the oligonucleotides
CC	which can interact with the folded target nucleic acid. Oligonucleotides
CC	from the present invention can be used in novel detection methods for
CC	clinical diagnostic purposes, including the detection and identification
CC	of pathogenic organisms (e.g. HIV). The method allows the ability to
CC	rapidly analyse nucleic acid structures. ABL46034 to ABL46367 represent
CC	sequences used in the exemplification of the present invention

XX Novel genetic variants of angiotensin receptor 2 isogenes, useful in
PT therapeutic purposes and in screening for drugs targeting the angiotensin
PT receptor protein.
XX
XX Claim 16; Page 20; 69pp; English.
XX
XX The invention relates to genetic variants of human angiotensin receptor 2
CC (AGTR2) isogenes and methods for detecting variants of AGTR2 gene.
CC Polynucleotides of the invention are useful in studying the expression
CC and biological function of AGTR2 and in developing drugs targeting AGTR2
CC protein. Methods of the invention are useful for studying population
CC diversity, anthropological lineage, the significance of diversity and
CC lineage at the phenotypic level, paternity testing, forensic applications
CC and for identifying associations between AGTR2 genetic variations and a
CC trait such as levels of drug response or susceptibility to disease. It is
CC useful in developing diagnostic tests and therapeutic treatments for
CC cardiovascular disorders, congenital abnormalities of kidney and urinary
CC tract (CAKUT) and premature ovarian failure (POF). The invention is
CC useful in gene therapy. The present sequence is an allele-specific
CC oligonucleotide (ASO) probe used to detect human AGTR2 gene polymorphisms

XX Novel enzymatic nucleic acid molecules which down regulates expression of
PT a sequence encoding a subunit of nuclear factor kappa B useful for
PT treating cancer, inflammatory disorders and autoimmune diseases.
XX
XX Claim 3; Page 61; 72pp; English.
XX
XX The invention describes an enzymatic nucleic acid molecule (I) which down
CC regulates expression of a sequence encoding a subunit of nuclear factor
CC

CC kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme
 CC configuration. The enzymatic nucleic acid molecule is adapted to treat
 CC cancer and is useful for down-regulating RBL-A activity in a cell, for
 CC treating a patient having a condition associated with the level of RBL-A.
 CC (I) is useful for cleaving RNA comprising a sequence of RBL-A gene, in
 CC the presence of a divalent cation, especially Mg²⁺. The enzymatic and
 CC antisense nucleic acid molecules are useful for treating breast, lung,
 CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,
 CC cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or
 CC multidrug resistant cancer. The method involves use of other drug
 CC therapies such as monoclonal antibodies, RBL-A-specific inhibitors or
 CC chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate,
 CC cyclophosphamide, doxorubicin, fluorouracil carboplatin, edatrexate,
 CC gemcitabine or radiation therapy. The enzymatic and antisense nucleic
 CC acid molecules are also useful for treating inflammatory disease such as
 CC rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,
 CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
 CC rejection, gene therapy applications, ischemia/reperfusion injury
 CC (central nervous system (CNS) and myocardial), glomerulonephritis,
 CC sepsis, allergic airway inflammation, inflammatory bowel disease or
 CC infection. This sequence represents the substrate of a novel enzymatic
 CC nucleic acid molecule

PT Use of non-viral agents for treating acne or acneform skin conditions,
PT particularly antisense oligonucleotides directed against androgen
PT receptor or 5alpha reductase.
XX
XX Example 1; Page 18; 36pp; German.
XX
CC This invention describes a novel method for treatment of acne and
CC acneform skin disorders, including rosacea, using a non-viral active
CC agent, prepared by molecular biological methods. The method comprises an
CC antisense oligonucleotide; (stabilised) ribozyme; (mirror) aptamer;
CC chimeric RNA/DNA oligonucleotide; naked plasmid DNA or DNA encapsulated
CC in a liposome, especially an antisense oligonucleotide specific for a
CC gene that encodes a steroid hormone receptor or steroid hormone
CC metabolising enzyme, particularly the androgen receptor and/or 5alpha-
CC reductase. The products of the invention have dermatological and
CC antiandrogenic activity and can inhibit the androgen-induced stimulation
CC of sebaceous gland activity. The method of the invention provides
CC effective treatment with reduced side effects and without the
CC difficulties associated with systemic administration. This sequence
CC represents a RT-PCR primer used to amplify the beta-actin gene, which is
CC used as a control during the amplification of the human androgen receptor
CC described in the disclosure of the invention

PT Novel enzymatic nucleic acid that down-regulates expression of neurite
PT growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or
PT protein kinase PKR genes, for treating cancer and inflammatory disease.
XX
XX Claim 59; SEQ ID NO 4406; 317pp; English.
XX
CC The invention comprises nucleic acids (e.g. antisense oligonucleotides)
CC that down regulate the expression or inhibit the function of a receptor
CC for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PTGDR),
CC IkappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the
CC invention are useful for treating: cerebrovascular accident, central
CC nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
CC lymphoma or glioma), inflammatory disease (e.g. rheumatoid arthritis,
CC restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
CC disease, lupus, multiple sclerosis, transplant/graft rejection,
CC ischaemia/reperfusion injury, glomerulonephritis, sepsis, and allergic
CC conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The
CC nucleic acids of the invention are also useful for down-regulating the
CC expression of a target gene and as a diagnostic tool to examine genetic
CC drifts and mutations within diseased cells or to detect the presence of a
CC target RNA in a cell. The present RNA sequence represents a human PKR
CC substrate sequence.

PT Identifying disease-sensitive gene, involves selecting single nucleotide
PT polymorphism (SNP) marker which are not unevenly distributed over
PT candidate regions of gene, and subjecting to linkage disequilibrium
PT analysis.
XX
XX Disclosure; SEQ ID NO 11; 53bp; Japanese.
XX
CC The invention relates to a method of identifying (M1) a disease-sensitive
CC gene using single nucleotide polymorphisms (SNPs) marker, by subjecting a
CC disease sensitive SNPs marker to linkage disequilibrium analysis and
CC specifying the region where linkage disequilibrium is observed and the
CC SNPs marker is contained in the candidate region, where SNP markers are
CC not unevenly distributed over the entire candidate regions of disease
CC sensitive gene. (M1) is useful for identifying a disease-sensitive
CC gene, e.g. for identifying type II diabetes sensitive gene. This sequence
CC represents a VIC-labelled probe to identify SNP260 in a disease
CC sensitivity gene used in the method of the invention.

XX Detecting an analyte such as protein or nucleic acid, useful for
XX screening drugs, comprises probe detection of captured analyte where
XX surplus probe signal is quenched and/or differential emission wavelength
XX of labeled support is measured.
XX
XX Example 1; Page 20; 61pp; English.
XX

CC The present invention describes a method for detecting an analyte in a
CC sample. The method comprises: (a) providing detection probes being
CC labelled with a first reporter, where the detection probes are capable of
CC binding to the analyte; (b) providing a solid support; (c) providing
CC capture probes being bound or capable of binding to the solid support,
CC where the capture probes are capable of binding to the analyte, and so
CC concentrating the analyte on the solid support; (d) contacting the sample
CC with the detection probes, the solid support; (e) detecting the detection
CC probes is conducted in the presence of quenching probes binding to
CC surplus detection probes not being bound to the analyte and thereby
CC quenching at least partially an emission of the first reporter of said
CC surplus detection probes, and/or (ii) the solid support is labelled with
CC a second reporter different from the first reporter, imaging the sample
CC at an emission wavelength of the second reporter, generating a mask
CC obtained from imaging the sample at the emission wavelength of the second
CC reporter and applying this mask to an image of the sample used for
CC detecting the detection probes. The present sequence represents a capture
CC oligonucleotide used in the detection of c-fos mRNA, which is used in an
CC example from the present invention.

XX dystrophy, amyotrophic lateral sclerosis, congestive obstructive
XX pulmonary disease, stroke, aging, diabetes, obesity, osteoporosis.
XX
XX Example 2; SEQ ID NO 302; 287pp; English.
XX

CC The present invention relates to novel binding agents comprising at least
CC one peptide capable of binding myostatin and inhibiting its activity. In
CC one embodiment, the binding agent comprises at least one myostatin-
CC binding peptide attached directly or indirectly to at least one vehicle
CC such as a polymer or an Fc domain. Myostatin (also known as
CC growth/differentiation factor 8, GDF-8) is a transforming growth factor-
CC beta (TGF-beta) family member known to be involved in regulation of
CC skeletal muscle mass. The binding agents increase lean muscle mass when
CC administered to animals and decrease fat to muscle ratios. The binding
CC agents are useful for treating muscle-wasting disease, e.g. muscular
CC dystrophy, amyotrophic lateral sclerosis, congestive obstructive
CC pulmonary disease, chronic heart failure, cancer, AIDS, renal failure,
CC uremia, rheumatoid arthritis, age-related sarcopenia, muscle-wasting due
CC to prolonged bedrest, spinal cord injury, stroke, bone fracture, or
CC aging, and myosin-related metabolic disorder, e.g. diabetes, obesity,
CC hyperglycaemia, bone loss, or osteoporosis. The present sequence is a
CC linker peptide coding sequence used to illustrate the invention.

PT New diagnostic composition comprising specific nucleic acid molecules,
XX useful for diagnosing or developing a compound for treating inflammatory
XX bowel diseases or related disease e.g., Crohn's disease and ulcerative
XX colitis.
XX
PS Example 1; SEQ ID NO 6; 63pp; English.
XX
CC This invention relates to a novel diagnostic composition that comprises
CC nucleic acid molecules bound to a solid support (or microarray), wherein
CC each nucleic acid can hybridise to an mRNA of a gene that shows abnormal
CC expression in an gastrointestinal condition. Specifically, it refers to
CC DNA oligos useful for preparing a microarray chip for the diagnosis of
CC inflammatory bowel disease, Crohn's disease, ulcerative colitis or a
CC disposition thereof. The present invention describes nucleic acid

CC molecules useful for screening methods to identify compounds that can be
CC used for therapy or to prevent progression of the aforementioned
CC conditions. As such, the pharmaceutical compositions developed
CC according to exhibit antiinflammatory and antiulcer activities. This
CC oligonucleotide sequence is an RT-PCR primer used to amplify human beta-
CC actin, an endogenous control gene used in an exemplification of the
CC invention.

PT High efficiency expression of recombinant human bone forming protein 4
XX and 7 using methanol yeast.
XX
PS Disclosure; Fig 1; 14pp; Chinese.
XX
CC The invention relates to a technique for using methanol yeast to
CC efficiently express human bone morphogenetic proteins (BMPs). The method
CC includes using the plasmids pBluescript KS-BMP4 and pBluescript KS-BMP7
CC containing human BMP-4 and BMP-7 cDNA sequences as template. PCR
CC amplification, fixed-point mutation to the arginine codon in the
CC sequence, and cloning it to methanol yeast expression plasmid pPIC9K. The
CC method further comprises transforming this plasmid into methanol yeast
CC GS115. The method is useful for using methanol yeast to efficiently
CC express human bone morphogenetic protein. This sequence represents a
CC sequence from BMP-4 DNA.

PX      Identifying a compound capable of modulating the action of the DLG5
PT      protein comprises subjecting one or more test compounds to a screen
PR      comprising DLG5 polypeptide, its homologue or fragment.
XX      Example 3; SEQ ID NO 172; 79pp; English.
PS      The invention relates to identifying a compound capable of modulating the
XX      action of the DLG5 protein comprising subjecting one or more test
CC      compounds to a screen comprising a DLG5 polypeptide appearing as
CC      ADY66112, its homologue or fragment. Also included are identifying a
CC      potential anti-inflammatory bowel disease (anti-IBD) therapeutic
CC      compounds, screening for a compound potentially useful for treating IBD,
CC      a cell comprising a reporter gene under the control of the DLG5 promoter,
CC      testing potential therapeutic agents for the ability to suppress IBD
CC      phenotype, identifying inhibitors of transcription of DLG5, preparing a
CC      pharmaceutical composition and diagnosing IBD or determining
CC      susceptibility to develop IBD. The methods are useful for identifying a
CC      compound capable of modulating the action of the DLG5 protein or
CC      diagnosing IBD. The compound that is able to modulate that activity or
CC      amount of DLG5 and methods are useful for preparing a medicament for
CC      treating IBD, ulcerative colitis and Crohn's disease. The human gene
CC      encoding DLG5 is located on chromosome 10-q22.3. The present sequence is
CC      a control PCR primer used in expression analysis of the dlgs gene.

XX Novel bispecific antibody substituting for function of cofactor that
```

PT enhances enzyme reaction, and recognizing both enzyme and substrates of
PT enzyme, useful for treating hemophilia A.
XX
XX Disclosure; SEQ ID NO 245; 69bp; Japanese.
XX
CC This invention describes a novel bispecific antibody which can act as a
CC cofactor to enhance an enzyme reaction and can recognize the enzyme and
CC the enzyme substrate. The antibody specifically binds to blood
CC coagulation factor VIII. The invention also describes a composition
CC comprising the antibody and a carrier, a kit useful in preventing and/or
CC treating bleeding associated with a disorder or from a disease caused by
CC bleeding. The composition includes blood coagulation factor VIII. The
CC antibody of the invention can be a blood-coagulation fibrinolytic related
CC factor including blood-coagulation factor VIII, blood coagulation factor
CC X, or blood-coagulation factor IX. The antibody comprises a complementary
CC determining region (CDR) of anti-blood-coagulation factor IX/Xa factor
CC antibody. The novel antibody or composition is useful for preventing
CC and/or treating a disease accompanying bleeding, or the disease resulting
CC from bleeding, where the disease accompanying bleeding or the disease
CC resulting from bleeding develops and/or progresses by an active reduction
CC or deletion of the blood coagulation factor VIII. The disease the
CC develops and/or progresses by an active reduction or deletion of the
CC blood coagulation factor VIII and/or activation blood coagulation factor
CC VIII, is hemophilia A or von Willebrand disease, where the hemophilia is
CC an acquired hemophilia A. This sequence encodes a fragment of the
CC antibody described in the method of the invention. Note: The sequence
CC data for this patent did not form part of the printed specification, but
CC was obtained in electronic format directly from WIPO at
CC ftp.wipo.int/pub/published_pct_sequences.

XX
XX Variable region gene of high neutralization activity monoclonal antibody
PT of tumor necrosis factor and its preparation.
XX
PS Claim 1; Page 3; 20pp; Chinese.
XX
XX The invention relates to a method for preparing variable region genes of
CC high neutralization activity tumor necrosis factor (TNF) resistant
CC monoclonal antibody (D2 mAb). The method comprises using recombinant
CC human TNF immune BALB/c mouse to prepare a plurality of mouse anti-TNF
CC monoclonal antibody, carrying out an extracorporeal blocking-up
CC experiment to screen anti-TNF monoclonal antibody with high
CC neutralization activity. By cloning the monoclonal antibody light chain
CC and heavy chain variable region (VL and VH respectively) genes, the
CC monoclonal antibody light chain and heavy chain variable region gene
CC sequence and amino acid sequence can be obtained, and the utility of the
CC gene sequence and protein sequence can be confirmed. This sequence
CC represents DNA encoding the complementarity determining region, CDR1 of
CC D2VH.

PT Modulating production of amyloidogenic peptide in, e.g. Alzheimer's
PT disease, by contacting cell and Nogo polypeptide with Nogo antagonist.
XX
PS Disclosure; SEQ ID NO 22; 53pp; English.
XX
CC The invention describes a method of modulating production of an
CC amyloidogenic peptide comprising contacting a cell which is expressing
CC the precursor from which the amyloidogenic peptide is derived and a Nogo
CC polypeptide, with a Nogo antagonist. Also described are: use of a Nogo
CC antagonist in the manufacture of a medicament for the treatment or
CC prophylaxis of a disease involving amyloidosis; and a method of treatment
CC or prophylaxis of Alzheimer's disease comprising administering to the
CC human in need an anti-Nogo antibody. The invention is used for modulating
CC production of amyloidogenic peptide in, e.g. Alzheimer's disease, stroke,
CC traumatic brain injury and spinal cord injury, fronto-temporal dementias,
CC peripheral neuropathy, Parkinson's disease, Huntington's disease,
CC Creutzfeldt-Jakob disease, amyotrophic lateral sclerosis, multiple
CC sclerosis, or inclusion body myositis. The invention provides an
CC unexpected route for therapeutic intervention in particularly Alzheimer's
CC disease. This sequence encodes anti-Nogo-antibody 2A10/3 heavy chain
CC complementarily determining region (CDR) 1.

PT New antibody or its functional fragment that binds with and neutralizes

PT human neurite outgrowth useful for treating or prophylaxis of stroke and
PT other neurological disease e.g. traumatic brain injury, spinal cord
PT injury, Alzheimer's disease.
XX
PS Disclosure; SEQ ID NO 22; 143pp; English.
XX
CC The invention describes an antibody (A1) or its functional fragment, that
CC binds with and neutralizes human neurite outgrowth (NOCO). Also described
CC are: providing a first vector encoding a heavy chain of the antibody;
CC providing a second vector encoding a light chain of the antibody; co-
CC transfected a mammalian host cell with the first and second vectors;
CC culturing the host cell in culture media (preferably serum free) under
CC conditions permissive to the secretion of the antibody from the host cell
CC into the culture media; recovering (and optionally purifying) the
CC secreted antibody; and promoting axonal sprouting involving contacting a
CC human axon with an anti-NOCO antibody. The antibody is useful in the
CC preparation of a medicament for treating or prophylaxis of stroke and
CC other neurological disease/disorders (e.g. traumatic brain injury, spinal
CC cord injury, Alzheimer's disease, frontotemporal dementias (taupathies),
CC peripheral neuropathy, Parkinson's disease, Huntington's disease and
CC multiple sclerosis); Creutzfeldt-Jakob disease (CJD), Schizophrenia,
CC amyotrophic lateral sclerosis (ALS), inclusion body myositis. The
CC antibody inhibits neurodegeneration and/or promotes functional recovery
CC in a human patient suffering, or at risk of developing, stroke or other
CC neurological diseases/disorder. This sequence encodes an antibody 2A10
CC heavy chain complementarily region (CDR) that can be used in the creation
CC of anti-NOCO-antibody of the invention.

XX Detecting (nucleic acid) analytes in a sample, useful in high throughput
 PT screening and diagnostics, comprises contacting the sample with detection
 PT probes, solid support and capture probes, and detecting by confocal
 PT observation.

XX Example 1; Page 22; 54pp; English.

XX The invention relates to a method of detecting analytes in a sample
 CC comprising providing a solid support, providing capture probes bound or
 CC capable of being bound to the support, providing detection probes capable
 CC of binding to the analytes, contacting the sample with the probes and
 CC solid support, and detecting through confocal observation the analytes
 CC which are bound to the detection probes. The method is useful for
 CC detecting (and optionally quantifying) analytes in a sample. The analytes
 CC are preferably nucleic acids. The method may comprise adding a
 CC potentially pharmaceutically active substance or drug modulates the
 CC sample and analyzing whether the substance or drug modulates the
 CC generation of the analytes. The method is useful in screening for
 CC potentially pharmaceutically active substances, in diagnostics, or in
 CC determining any potential side effects of drugs. The method is suitable
 CC for detecting low concentrations of nucleic acid analytes without
 CC amplification steps, and with direct detection of the analytes in a
 CC homogeneous format without washing or other separation steps. The method
 CC is suitable for high throughput applications such as mass diagnostics and
 CC drug testing and development. The present sequence represents a human c-
 CC fos FRBT quencher oligonucleotide.

Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

Vector: pBluescript II KS(+) R. Site1: EcoRI R. Site2: NotI 5' Seq
Primer T7 Strain Lohman Brown Layer/Ross 308 Prolifer cross This
normalized library was constructed from 1 million independent
clones. cDNA synthesis was initiated using an oligo(dT) primer,
using methylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA was
blunted, ligated to NotI adapters, digested with EcoRI,
size-selected, and cloned into the NotI and EcoRI compatible sites
of a custom modified MCS of the pBluescript (KS+) vector. The
library was normalized in 2 rounds using conditions adapted from
Soares et al., PNAS (1994) 91: 9228-9232 and Bonaldi et al., Genome
Research 6 (1996): 791, except that a significantly longer
reannealing hybridization was used. Clones available from the
ARK-Genomics Centre for Functional Genomics in Farm Animals, Roslin
Institute, Midlothian, EH25 9PS, UK see www.ark-genomics.org.

TITLE
JOURNAL T-DNA integration into the Arabidopsis genome depends on sequences of pre-insertion sites

COMMENT
EMBO Rep. 3 (12), 1152-1157 (2002)
12446565
2 (bases 1 to 13)
Balzerque, S.
Direct Submision
Submitted (23-OCT-2003) Balzerque S., UMRGV, INRA/CNRS, 2 rue
Gaston Cremieux, 91057 Evry cedex, FRANCE
PCR was performed on DNA from transformants of Arabidopsis thaliana
plants from INRA (Versailles). The DNA fragment(s) resulting from
the PCR were directly sequenced from the left or the right border
to determine the genomic sequence flanking the insertion. T-DNA
derived sequences were removed. Information to order the
corresponding mutant line and a link to a database providing a
graphical display of the insertion site are available at
<http://dbsgap.versailles.inra.fr/publiclines/>. This sequence has
been generated in the framework of the French plant genomics
program 'Genoplante' (<http://www.genoplante.com> and
<http://genoplante-info.infobiogen.fr>).

PCR was performed on DNA from transformants of Arabidopsis thaliana plants from INRA (Versailles). The DNA fragment(s) resulting from the PCR were directly sequenced from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at <http://dbgap.versailles.inra.fr/publiclines/>. This sequence has been generated in the framework of the French plant genomics program 'Genoplante' (<http://www.genoplante.com> and <http://genoplante-info.infobiogen.fr/>).

Roelin, Midlothian, EH25 9PS, UNITED KINGDOM
Vector pBluescript II KS(+). R. Site1: EcoRI. R. Site2: NotI 5' Seq
Primer T7 Strain Lohman Brown layer/Ross 308 broiler cross This
normalized library was constructed from 1 million independent
clones. cDNA synthesis was initiated using an oligo(dT) primer,
using methylated C in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA was
blunted, ligated to NotI adapters, digested with EcoRI,
size-selected, and cloned into the NotI and EcoRI compatible sites
of a custom modified MCS of the pBluescript (KS+) vector. The
library was normalized in 2 rounds using conditions adapted from
Scores et al., PNAS (1994) 91: 9228-9232 and Bonaldo et al., Genome
Research 6 (1996): 791, except that a significantly longer

reannealing hybridization was used. Clones available from the ARK-Genomics Centre for Functional Genomics in Farm Animals, Roslin Institute, Midlothian, EH25 9PS, UK see www.ark-genomics.org.

TITLE	Direct Submission
JOURNAL	Submitted (21-NOV-2002)
COMMENT	Balzerque S., UMRGV, INRA/CNRS, 2 rue Gaston Cremieux, 91057 Evry cedex, FRANCE PCR was performed on DNA from transformants of Arabidopsis thaliana

plants from INRA (Versailles). The DNA fragment(s) resulting from the PCR were directly sequenced from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at <http://dbgap.versailles.inra.fr/publiclines/>. This sequence has been generated in the framework of the French plant genomics program "Genoplante" (<http://www.genoplante.com> and <http://genoplante-info.infobiogen.fr>).

 PCR was performed on DNA from transformants of Arabidopsis thaliana plants from INRA (Versailles). The DNA fragment(s) resulting from the PCR were directly sequenced from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at <http://dbsgap.versailles.inra.fr/publiclines/>. This sequence has been generated in the framework of the French plant genomics program 'Genoplante' (<http://www.genoplante.com> and <http://genoplante-info.infobiogen.fr>).

PCR was performed on DNA from transformants of Arabidopsis thaliana plants from INRA (Versailles). The DNA fragment(s) resulting from the PCR were directly sequenced from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at <http://dbsgap.versailles.inra.fr/publiclines/>. This sequence has been generated in the framework of the French plant genomics program 'Genoplante' (<http://www.genoplante.com> and <http://genoplante-info.infobiogen.fr>).

COMMENT This GSS is part of a random genomic sequencing program of thirteen
yeast species: *Saccharomyces bayanus* var. *uvarum*, *Saccharomyces*
exiguus, *Saccharomyces servazzii*, *Zygosaccharomyces rouxii*,
Saccharomyces kluyveri, *Kluyveromyces thermotolerans*, *Kluyveromyces*
lactis var. *lactis*, *Kluyveromyces marxianus* var. *marxianus*, *Pichia*
angusta, *Debaryomyces hansenii* var. *hansenii*, *Pichia sorbitophila*,
Candida tropicalis and *Yarrowia lipolytica*. Genomic inserts of 3 to
5 kb were prepared and both extremities were sequenced. See
keywords for description of this sequence and for the sequence of
the other extremity of this insert.

COMMENT Submitted (23-OCT-2003) Balergue S., UMRGV, INRA/CNRS, 2 rue Gaston Cremieux, 91057 Evry cedex, FRANCE
PCR was performed on DNA from transformants of Arabidopsis thaliana plants from INRA (Versailles). The DNA fragment(s) resulting from the PCR were directly sequenced from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at <http://dbsgap.versailles.inra.fr/publiclines/>. This sequence has been generated in the framework of the French plant genomes program 'Genoplante' (<http://www.genoplante.com> and <http://genoplante-info.infobiogen.fr>). Location/Qualifiers

reveals likely components of phytopathogenicity shared with true
fungi

Mauch,F., van West,P., Waugh,M.E., Yu,J., Boller,T., Kamoun,S.,
Lam,S.T. and Udelsom, H.S.
Large-scale gene discovery in the oomycete Phytophthora infestans
reveals likely components of phytopathogenicity shared with true
fungi

TITLE Mol. Plant-Microbe Interact. 18 (3), 229-243 (2005)
JOURNAL 15782637
PUBMED
COMMENT Contact: Judelson HS

 TITLE This GSS is part of a random genomic sequencing program of thirteen
 yeast species: Saccharomyces bayanus var. uvarum, Saccharomyces
 ekebergii, Saccharomyces servazzii, Zygosaccharomyces rouxii,
 Saccharomyces kluyveri, Kluyveromyces thermotolerans, Kluyveromyces
 lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia
 angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila,
 Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to
 5 kb were prepared and both extremities were sequenced. See
 keywords for description of this sequence and for the sequence of
 the other extremity of this insert.
